

Figure S3. Expression of maturation-associated molecules on CD4⁺ T cells. The percentages of CD4⁺ T lymphocytes that express CD28⁺CD95⁻(Naïve), CD28⁺CD95⁺(CM), and CD28⁻CD95⁺(EM) are shown for both the *Mamu-A*01* positive and *Mamu-A*01* negative cohorts of monkeys prior to SIVsmE660 challenge. No statistically significant differences in the magnitudes of the cell subpopulations were noted as determined by the Mann-Whitney test in those animals that became infected and those that resisted infection.
