Table Supplement 1. Pertinent negative candidate predictors from the multivariable linear model of annual eGFR$_{cys}$ change in HIV-infected participants (Table 4).

| | Adjusted effect (ml/min/1.73 m^2 per year)*, $n = 554$ | | |
	Effect	95% CI	*P* value
Risk factors for kidney disease			
Baseline proteinuria	−0.10	(−1.81, 1.62)	0.91
HCV RNA+	−0.69	(−1.69, 0.32)	0.18
Heroin use	−0.28	(−1.30, 0.74)	0.59
C-reactive protein (CRP, log2)	0.21	(−0.01, 0.42)	0.060
Anti-retroviral drugs**			
Abacavir	−0.10	(−0.35, 0.15)	0.42
Tenofovir	0.05	(−0.26, 0.36)	0.73
Indinavir	−0.16	(−0.55, 0.24)	0.44
Didanosine	0.10	(−0.25, 0.45)	0.56
Efavirenz	0.22	(−0.03, 0.47)	0.089

*Effect of adding each variable as a single additional predictor to the model shown in Table 4.
**Per year of use through the follow-up visit.
