

Supplementary Data

SUPPLEMENTARY FIG. S1. Analysis of vRNA content of VLPs produced by 92BR cultures pseudo-infected with mutant EIAV viruses. Supernatants from day 34 p.t. of the timecourse study (Figure 5) were analysed for vRNA content (GagPol slip region) by quantitative RT-PCR and for RT activity by PERT (n=2). See Materials and Methods for lower-limits of detection for assays.
