

Figure S3: Inhibition of dynamin GTP-ase activity does not induces fusion between chromaffin granules in stimulated cells. No evidence of fusion between granules or compound exocytosis was observed under electron microscopy in cells stimulated with 10 μ M DMPP and treated with 100 μ M dynasore or the vehicle DMSO. Scale bar = 1 μ m. Note that no differences in granule diameter were found between dynasore and DMSO treated cells under stimulation. At least 25 vesicles per cell and 5 cells per each condition were measured.
