

ImP Microparticles

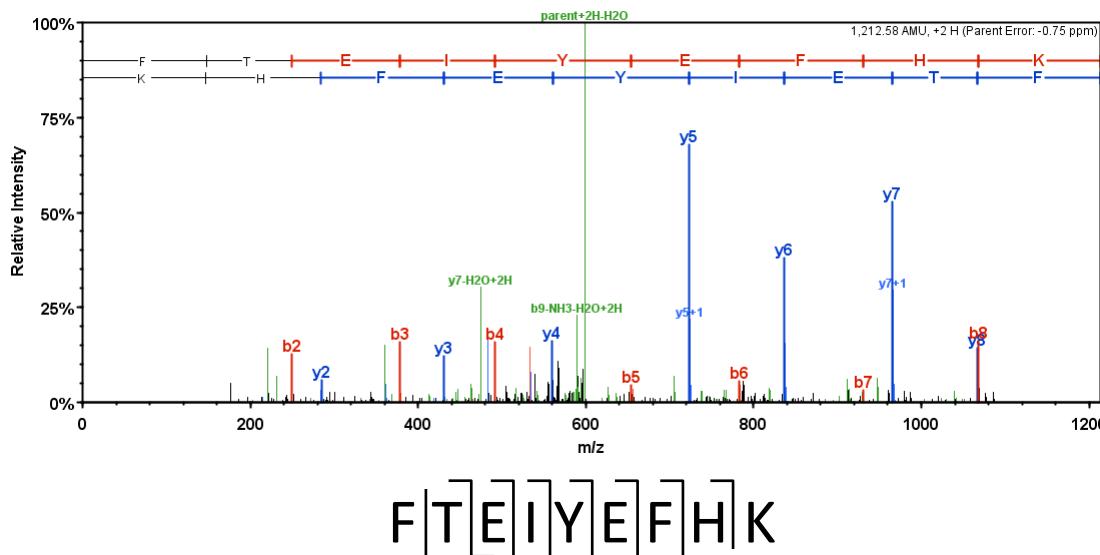

FIP Microparticles

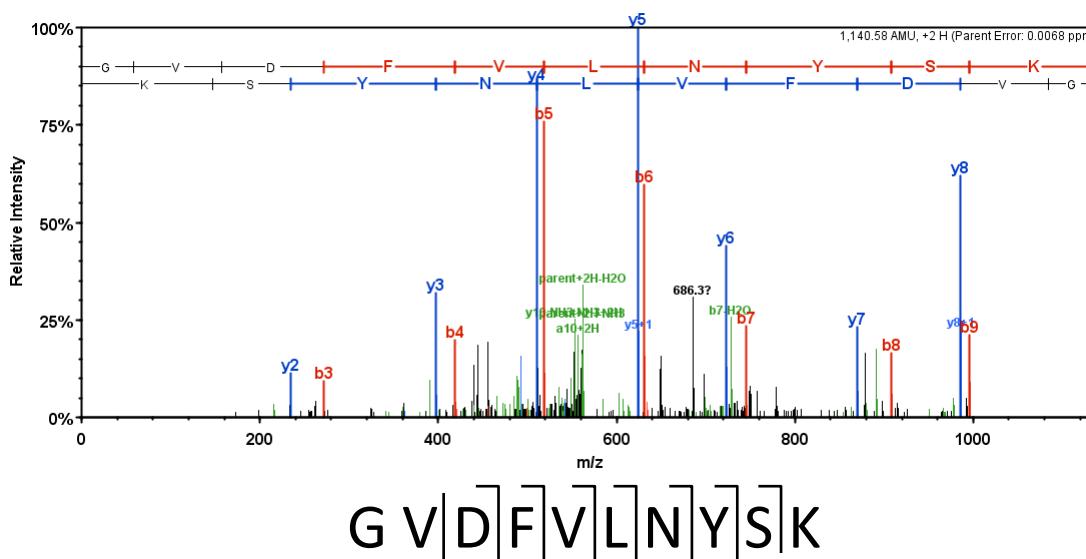

Supplementary Figure 1: No evidence for platelet, endothelial and monocyte microparticles in the neutrophil microparticle preparations. Microparticles were suspended in PBS (containing calcium and magnesium) and incubated with mouse anti human -CD62P, CD41 (platelet microparticle markers), CD54 (endothelial microparticle marker) or anti-CD14 (monocyte microparticle marker) conjugated antibodies. Staining was then assessed using a FACS Canto II and data analysed using FlowJo software. Results are representative of n=5 microparticle preparations.

A

B

Supplementary Figure 2: Evidence for the presence of NCF-1 and 5-lipoxygenase in FIP microparticles. Mass spectra employed for the identification of (A) NCF-1 and (B) 5 lipoxygenase in FIP microparticles.
