

Supplemental Figure 1

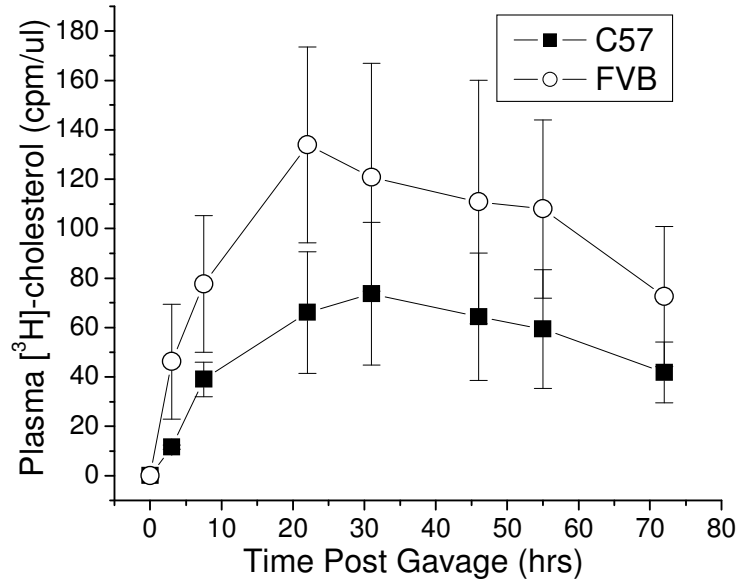

Figure Legend

Supplemental Figure 1. Cholesterol absorption rates in FVB vs C57 mice 72 hours following olive oil gavage. Non-fasted C57 and FVB mice were gavaged with 2 μCi [^3H]-triolein in 200 μl olive oil. Plasma samples were collected over the course of 72 hours with mice given access to standard chow diet through the duration of the experiment. Plasma [^3H]-cholesterol was measured by liquid scintillation counting. Data represent mean \pm standard deviation of triplicate mice.
