A

B

Supplemental Figure 1: Receiver operator characteristic (ROC) curves for predicting CAD risk.
ROC curves were constructed using classical risk factors ± IF1 (A), HDL-C ± IF1, after adjustment for classical risk factors (B). Classical risk factors were smoking, physical activity, alcohol consumption, CRP, Lp(a), TG, and treatment for dyslipidemia, hypertension and diabetes.
The diagonal line indicates a test with an area under the ROC curve of 0.5.
