

Table S1: Influence of independent factors on the number of prosocial behavior from bystanders in Analysis 2, Model 1

Independent term		Coef	SE (coef)	<i>t</i>	<i>P</i> (> <i>t</i>)
Factors	Level				
Intercept		- 0.77	0.37	- 2.10	0.04
Context	PP	2.44	0.37	6.64	< 0.001
Familiarity between focal children and bystanders		4.28	1.67	2.56	0.01
The focal children's usual frequency of receiving prosocial behavior		< 0.01	0.12	- 0.01	0.99

We analyzed the data in 168 sessions (84 PP-MC pairs, focal child = 12, bystander = 30, focal-bystander dyad = 60) in Analysis 2, Model 1. In the factor "context", the parameters were shown in the same way as Table 2.
