

Table S4: Influence of independent factors on the number of affiliative behavior from bystanders in Analysis 3 (recalculation of Analysis 1, Model 2)

Independent term		Coef	SE (coef)	<i>t</i>	<i>P</i> (> <i>t</i>)
Factors	Level				
Intercept		0.15	0.48	0.32	0.75
Context	PP	0.45	0.09	5.22	< 0.001
Familiarity between focal children and bystanders		2.34	0.61	3.83	< 0.001
The focal children's usual frequency of receiving affiliative behavior		0.01	0.01	2.17	0.03

We analyzed the data in 382 sessions (191 PP-MC pairs, focal child = 12, bystander = 44, focal-bystander dyad = 94) in Analysis 3 (recalculation of Analysis 1, Model 2). In the factor "context", the parameters were shown in the same way as Table 2.
