

Supplemental Table 1 Multivariable Hazard Ratios (HR) and 95% Confidence Intervals (CI) for Incident Cardiovascular Events (Excluding Coronary Revascularization) Associated with Presence of Minor Isolated Q Waves Stratified by Race/Ethnicity

	Model 1* HR (95% CI)	Model 2† HR (95% CI)
White	0.73 (0.36-1.49)	0.71 (0.34-1.45)
Black	1.55 (0.78-3.11)	1.44 (0.70-2.94)
Hispanic	2.51 (1.35-4.67)	2.50 (1.33-4.70)

The Chinese group was excluded from multivariable analysis because of its small number of events.

*Model 1: Demographic variables (age and sex), socioeconomic status (education and income) and cardiovascular disease risk factors (body mass index, total cholesterol, lipid-lowering drugs, smoking status, systolic blood pressure, blood pressure lowering drugs, diabetes).

†Model 2: Variables in Model 1 plus other ECG abnormalities (abnormal QRS axis, ST/T abnormalities, left ventricular hypertrophy, and intraventricular conduction defects).
