* Epitope sequences obtained by clonal sequencing

Supplementary Table 1: Subjects characteristics in acute/early HIV infection. Number of days post-infection (INF days), Fiebig stage, peripheral blood CD4 and CD8 T cell counts, HIV plasma viral load, age, sex, HLA-A and-B haplotypes, virus clade, and HIV-specific CD8 T cell responses studied are depicted for each subject with their corresponding autologous sequence. The autologous sequences of the potential epitopes based on the HLA typing that were not detected by tetramer staining are also depicted. Epitope sequences highlighted in purple represent escape variants in a non-anchored residue, and epitope sequences highlighted in orange represent escape variants in an anchored residue. HIV specificities highlighted in pink were used for the gene expression analyses.

* Epitope sequences obtained by clonal sequencing

Supplementary Table 2: Subjects characteristics in chronic HIV infection. Number of days post-infection (INF days), Fiebig stage, peripheral blood CD4 and CD8 T cell counts, HIV plasma viral load, age, sex, HLA-A and-B haplotypes, virus clade, and CMV and HIV-specific CD8 T cell responses studied are depicted for each subject with their corresponding autologous sequence. The autologous sequences of the potential epitopes based on the HLA typing that were not detected by tetramer staining are also depicted. Epitope sequences highlighted in purple represent escape variants in a non-anchored residue, and epitope sequences highlighted in orange represent escape variants in an anchored residue. HIV and CMV specificities highlighted in pink were used for the gene expression analyses.

Supplementary Table 3: Comparison of clinical data means between the entire cohorts and the subgroup of donors selected for gene array analysis. In the acute/early group selected for gene expression, the analyzed specificities were: 1 B7TL10, 2 B8FL8, 1 B8GI9, 1 A2FK10, 1 A3RK9, 1 A24RW8 and in the chronically infected group: 1 B7TL10, 2 B8FL8, 1 B8GI9, 2 A2FK10. The CMV specificities were analyzed in the same chronically infected individuals than the analyzed HIV specificities.

	Days Post Infection	CD4 Count/ul	CD8 Count/ul	Viral Load (copies/ml)
Primary infected cohort	53	487	1554	1,224,791
Selected AEI donors for gene arrays	60	380	1560	377,872
Chronically infected cohort	More than 6 months	455	795	105,696
Selected CI donors for gene arrays	More than 6 months	421	866	62,724

Supplementary Table 4: Complete list of the 10630 filtered probes used for gene expression analysis.

Supplementary Figure 1: Secretion of TNF and IL-2 by HIV and CMV-specific CD8 T cells after antigenic stimulation in primary and chronic infection. **A, B.** Percentage of cytokine secreting cells in tetramer+ cells for HIV (diamond) and CMV (circles) specific CD8 T cells in primary and chronic infection for TNF (A) and IL-2 (B). **C, D.** Percentage of HIV or CMV-specific CD8 T cells tetramers+ in primary and chronic infection in subjects analyzed for the functionality described Figure 5B and 5H: for the cytokine secretion (**C**) and the cytolytic capacity (**D**). No significant difference was observed between the percentage of HIV or CMV tetramers + in primary infection (HIV P or CMV P) and the percentage of HIV or CMV tetramers + in chronic infection (HIV C or CMV C).
