JCB

Tamura et al., <http://www.jcb.org/cgi/content/full/jcb.201302067/DC1>**A****B**

**Figure S1. Identification of phosphorylated regions by LC-MS/MS.** To identify the phosphorylation sites on PpAtg18, the GST-fused protein was purified from *P. pastoris* and was analyzed by LC-MS/MS. The MS analysis covered 85% of the total PpAtg18 protein, and identified two monophosphorylated peptides, one corresponding to 385-RVSSTS<sup>L</sup>G<sup>S</sup>Y<sup>G</sup>S<sup>Q</sup>E<sup>S</sup>I<sup>C</sup>D<sup>K</sup>I<sup>E</sup>P<sup>H</sup>V<sup>D</sup>S<sup>A</sup>R-413 (A) and the other to 466-TVVAI<sup>G</sup>N<sup>S</sup>V<sup>G</sup>Q<sup>G</sup>E<sup>L</sup>L<sup>Q</sup>L<sup>G</sup>E<sup>H</sup>E<sup>D</sup>V<sup>D</sup>N<sup>S</sup><sup>S</sup><sup>T</sup><sup>S</sup><sup>D</sup><sup>S</sup><sup>T</sup><sup>F</sup><sup>H</sup><sup>Q</sup><sup>K</sup>-502 (B). Both peptides possess nine Ser/Thr residues. These two peptides were then subjected to targeted MS/MS analysis, which identified 387-SSTS-391 and 492-SSTS-495 as the phosphorylated regions in peptides A and B, respectively although the phosphorylated residue in these two regions could not be determined.

**Figure S2. Purification of PpAtg18 proteins from *P. pastoris*.** (A) SDS-PAGE of purified GST-PpAtg18 variants. The gel was stained with CBB. These proteins were purified as well as GST-PpAtg18Wt. An equal mole of each sample was applied to the gel. (B) Surface plasmon analysis. The interaction between PpAtg18 and liposomes was assessed by a Biacore system set L1 sensor chip (GE Healthcare). For surface plasmon, PpAtg18 was eluted from a GS 4B column with PreScission protease (GE Healthcare). (C) PI(3,5)P<sub>2</sub>-binding activity of PpAtg18 SA and PpAtg18 AS proteins. The designated PpAtg18 variants fused to GST were incubated at a concentration of 1  $\mu$ g/ml with nitrocellulose membrane onto which PI(3,5)P<sub>2</sub> was spotted with the same concentration gradient as PIP Array. (D) Identification of amino acid residues critical for phosphorylation of PpAtg18. Experiments were performed as described in Fig. 3 (A and B).

**Figure S3. Role of PpAtg18 in autophagic pathways.** (A) Colocalization of PpAtg18 and PpAtg8. In this experiment, PpAtg18-tagged CFP at the N terminus was expressed under the *PpACT1* promoter. Each strain was transferred from methanol medium to glucose medium for 30–60 min. Vacuoles were stained with FM 4-64. Bars, 2  $\mu$ m. (B) YFP-PpAtg8 procession assay during nitrogen starvation in PpAtg18 AA and DD mutant strains. This procession experiment was referred from a previous report (Yamashita et al., 2009). Cells grown in SD were shifted to SD-N medium and collected at indicated time point. These blots were incubated with anti-GFP monoclonal antibody (Molecular Probes). (C) Western blotting of PpAtg18-5xFlag under nitrogen starvation. Cells grown on SD were shifted to SD-N. (D) Western blotting of PpAtg18-5xFlag in *Ppatg2Δ* cells. Cells grown on SD medium were shifted to SD-glucose or SD + 0.9 M NaCl similar to Fig. 4 A. (E) Western blotting of PpAtg18-5xFlag with a Phos-tag in *Ppyck3Δ*. Cell lysates were obtained from SD culture of the designated strains harboring PpAtg18-5xFLAG, and were subjected to immunoblot analysis as described in Fig. 3 A.

Table S1. Yeast strains used in this study

Designation	Description	Genotype	Reference
PPY12	Wild type	<i>arg4 his4</i>	Sakai et al., 1998
