

SUPPLEMENTARY FIG. S2. Representative histological images of Oil Red O staining for mature adipocytes after 6 months in static culture conditions. Scaffold type, aqueous (**a–d**) and solvent (**e–h**)-based scaffolds were evaluated. Scaffold coatings, uncoated (**a, e**), vascular endothelial growth factor (VEGF) (**b, f**), laminin (**c, g**), and VEGF+laminin (**d, h**) were also compared. Black arrows point to regions of Oil Red O positive staining. Scale bar: 50 μ m.
