LEGENDS TO SUPPLEMENTAL DATA

Supplemental Figure 1: Memantine fold shifts ($IC_{50}(\text{mutant})/IC_{50}(\text{wild type})$) of mutant NMDA receptors containing a conventional or an unnatural mutation in the transmembrane region. Abbreviation used are F4W, 2,3,4,5-fluoro-Trp; Cha, cyclohexylalanine; hGln, homoglutamine; F3-Phe, 3,4,5-fluoro-Phe. *, Conventional mutations performed through the nonsense-suppression method. Unnatural amino acid mutagenesis was performed using established protocols.¹

Supplemental Figure 2. Representative response curves. A. Wild type receptor exposed to 5.6 μM memantine (solid line). B. N1-645N exposed to 100 μM memantine (solid line).

Supplemental Table 1: Glutamate EC₅₀ ± s.e.m. and Hill constant of wild-type and mutant NMDA receptors. Hill equation was used to fit data: $I/I_{max} = 1/(1 + (EC_{50}/[A])^n_H)$, where I_{max} is the current response to agonist activation, I is the agonist-activated current measured in the presence of antagonist at the concentration (A).
