| 3 | RESULTS FROM THE LPS GROUP |
| 4 | |
| 5 | In order to compare the <i>E. coli</i> whole bacteria group, with the more frequently used |
| 6 | endotoxin (LPS) model, we included an LPS group for comparison. The data are |
| 7 | reported below and presented in supplemental figures and figure legends. |
| 8 | |
| 9 | E. coli DNA |
| 10 | |
| 11 | E. coli DNA was measured in two animals from the LPS group as controls. No E. coli |
| 12 | DNA was detected in the organs from these animals (data not shown). |
| 13 | |
| 14 | LPS load |
| 15 | |
| 16 | LPS in the positive control samples were detected mainly in the lungs (mean 4.8 EU/ $$ |
| 17 | mg tissue, range 4.774-4.83 EU/ mg tissue), in low levels in the spleen (mean 0.43 |
| 18 | EU/ mg tissue, range 0.142-0.671 EU/ mg tissue), very low levels in the liver (mean |
| 19 | 0.1 EU/ mg tissue, range 0.064-0.171 EU/ mg tissue) and was undetectable in the |
| 20 | kidney. |
| 21 | |
| 22 | Comparison of the LPS load between the anti-CD14 group and the positive control |
| 23 | group |
| 24 | |

| 25 | There was a slightly higher LPS amount in the anti-CD14 groups compared to the |
|----|---|
| 26 | positive control groups in the lungs, liver and spleen (Supplemental Figure S1). In the |
| 27 | kidneys, there was an ignorable amount of LPS (comparable to background values) |
| 28 | detected in both the anti-CD14 group and the positive control group. |
| 29 | |
| 30 | Inflammatory markers |
| 31 | |
| 32 | In the LPS group, only cytokines measured by enzyme-immunoassays were included |
| 33 | |
| 34 | TNF was increased in all the organs in the positive control group (Supplemental |
| 35 | Figure S2). There was a slightly higher load in the spleen compared to the other |
| 36 | organs |
| 37 | |
| 38 | IL-1 β was increased in all the organs in the positive control group (Supplemental |
| 39 | Figure S2). There was a substantially higher load in the spleen compared to the other |
| 40 | organs. The IL-1 β load in kidney was substantially lower than in all the other organs. |
| 41 | |
| 42 | IL-6 was increased in all the organs in the positive control group (Supplemental |
| 43 | Figure S2), but with very low levels in kidney. There was a substantially higher load |
| 44 | in liver and spleen compared to lung and kidney. |
| 45 | |
| 46 | IL-8 was increased in all the organs in the positive control group (Supplemental |
| 47 | Figure S2), but with very low levels in the liver. There was a substantially higher load |
| 48 | in spleen compared to the other organs. IL-10 was detected in liver and kidney, but |
| 49 | not in lung and spleen (data not shown). |

51 Effect of anti-CD14 on the cytokine load

| 53 | A similar inhibitory effect of anti-CD14 as described for the E. coli group was seen in |
|----|---|
| 54 | the LPS group (Supplemental Figure S3). Additionally, anti-CD14 had a pronounced |
| 55 | inhibitory effect on the TNF level in the liver and kidney, not seen in the E. coli |
| 56 | group. |
| 57 | |
| 58 | |
| 59 | |
| | |

61 Supplemental figure legends

| 62 63 | Figure S1 Effect of anti-CD14 on LPS load in the organs in the LPS group |
|----------|--|
| 64 | LPS load in the organs in the positive control group compared to the anti-CD14 group |
| 65 | in the LPS group is shown. Data are presented as mean with range. |
| 66 | |
| 67 | Figure S2 Cytokine load in the organs in the LPS group |
| 68 | The organ load of the proinflammatory cytokines TNF, IL-1 β , IL-6 and IL-8 in the |
| 69 | organs in the positive control group is shown in the LPS group. Data are presented as |
| 70 | mean with range. |
| 71 | |
| 72 | Figure S3 Effect of anti-CD14 on the proinflammatory cytokine load in the organs in |
| 73 | the LPS group |
| 74 | Load of the proinflammatory cytokines TNF, IL-1 β , IL-6 and IL-8 in the organs in the |
| 75 | positive control group compared to the anti-CD14 group in the LPS group is shown. |
| | |

76 Data are presented as mean with range.
