

## Supplementary Fig 4.

**A.**

**Supplementary Fig. 4.** Effect of MIF on the expression of Fasn. (A) HepG2 cells were pre-treated with compound C (10 μM) for 30 min and were then stimulated with MIF or AICAR for 1 h. Cell lysates were analyzed by RT-PCR analysis with Fasn specific primer. 18s rRNA levels were used as a control. \*\* $p < 0.01$  vs. control values (one-way ANOVA). Data are expressed as the means  $\pm$  SD of triplicate analyses.
