

Supplementary Fig 5.

Supplementary Fig. 5. (A) Mice were administrated with Vehicle (saline), AICAR or MIF under conditions of TO901317 (n=4, respectively) stimulation. Intracellular TG contents were measured after 5 day of administration. The mice liver of the each experimental group were prepared for cryosection with optimal cutting temperature (OCT) compound and stained with Oil Red O and hematoxylin to observe the accumulation of lipids using microscopy (IX71, Olympus, Japan).
