

RISK SERVICE USER GUIDE

developed jointly by the HughesRiskApps Group at the Massachusetts General Hospital
and the Bayes Mendel Lab at the Dana Farber Cancer Institute

prepared by Phil Bosinoff
Deep Code Consulting
phil@deep-code.com
June 5, 2012

Overview

This is a brief user guide for the Risk Service. This web service provides risk calculations for multiple cancer risk models: BRCAPRO, MMRpro, PancPRO, and MelaPro from the BayesMendel R package, Tyrer-Cuzick, and the NCI's Colorectal Cancer Risk Assessment Tool (CCRAT). Use of Tyrer-Cuzick may require separate licensing. Input and output messages to/from the service use the HL7 Family History (XML) format.

The WSDL is located at <http://bayesmendel.dfcI.harvard.edu:8080/RiskService/services/Converter?wsdl>. Standard SOAP protocols apply.

To access this web service, the user must have a valid user agreement and user license in place.

Contact Giovanni Parmigiani at DFCI to obtain a user license.

The Risk Service can be used free of charge by all academic institutions, research institutions, and health care providers.

Direct interactions with the Risk Service by commercial products requires a commercial license. Results from the Service cannot be embedded in commercial software, or otherwise provided to third parties, without a commercial license.

Acknowledgement

Acknowledgement of use of this service in any promotional materials and at time of use is required. The acknowledgement must read as follows:

“Computations are provided by the Risk Web Service developed jointly by the HughesRiskApps Group at the Massachusetts General Hospital and the BayesMendel Lab at the Dana Farber Cancer Institute”

Invoking the Risk Service from client software

The Risk Service is invoked using the `getRiskHL7()` or `getRiskHL7Selected()` methods.

Here is the `getRiskHL7()` method signature:

```
getRiskHL7(string hl7String, string id, boolean testData, boolean researchUseOk)
```

Parameters:

<code>hl7String</code>	- Input HL7 (XML) String containing HL7 family history data
<code>id</code>	- License Id
<code>testData</code>	- True for test data, false for real data
<code>researchUseOk</code>	- True if ok for DFCI to use family data for research purposes, false if not

Return value:

a String consisting of an HL7 message consisting of the original HL7 message with risk calculation results appended. See Appendix C for an example.

`getRiskHL7Selected()` gives the client more detailed options regarding exactly which models she wishes to run, whether to run them for all family members or just the counselee (proband), and whether the BayesMendel hazard rate data is needed in the reply message. Here is the `getRiskHL7Selected()` method signature:

```
getRiskHL7Selected(string hl7String, string id, boolean testData, boolean
researchUseOk, string[] models, boolean counseleeOnly, boolean noHazardRates)
```

Parameters:

<code>hl7String</code>	- Input HL7 (XML) String containing HL7 family history data
<code>id</code>	- License Id
<code>testData</code>	- True for test data, false for real data
<code>researchUseOk</code>	- True if ok for DFCI to use family data for research purposes, false if not
<code>models</code>	- String array of models to run. For example: String[] {"BrcaPro", "MmrPro", "PancPro", "MelaPro"}
<code>counseleeOnly</code>	- True for probCarrier results on proband only, false for probCarrier results for all family members
<code>noHazardRates</code>	- True to not include Hazard Rates in reply message, false to include Hazard rates in reply message.

Return value:

a String consisting of an HL7 message consisting of the original HL7 message with risk calculation results appended. See Appendix C for an example.

Calling `getRiskHL7(hl7String, id, testData, researchUseOk)` is equivalent to calling `getRiskHL7Selected(hl7String, id, testData, researchUseOk, new String[] {"BrcaPro", "MmrPro", "PancPro", "MelaPro", "Tyrer-Cuzick", "ccrat"}, false, false)`.

The `models` string array must specifically contain one or more of "BrcaPro", "MmrPro", "PancPro", "MelaPro", "Tyrer-Cuzick", "ccrat". Any other strings in the array will be ignored.

Refer to Appendix D for Disease Codes, Appendix E for Race Codes, and Appendix F for Gene Codes. Appendix D's disease codes show the relevant meaning for use within the risk models. For example, this subset of codes all mean "Breast Cancer"; there are other codes that mean Breast Cancer as well. If a clinical observation has SNOMED code 254837009, or NCI codes C4872, C9245, or C9119, it will be considered Breast Cancer:

```
<row>
  <code>254837009</code>
  <codeSystem>SNOMED_CT</codeSystem>
  <Mgh>Breast Cancer</Mgh>
  <meaning>Breast Cancer</meaning>
</row>
<row>
  <code>C4872</code>
  <codeSystem>NCI</codeSystem>
  <Mgh>Breast Cancer</Mgh>
  <meaning>Breast Cancer</meaning>
</row>
<row>
  <code>C9245</code>
  <codeSystem>NCI</codeSystem>
  <Mgh>Breast Cancer (Invasive)</Mgh>
  <meaning>Breast Cancer</meaning>
</row>
<row>
  <code>C9119</code>
  <codeSystem>NCI</codeSystem>
  <Mgh>Breast Cancer (Medullary)</Mgh>
  <meaning>Breast Cancer</meaning>
</row>
```

The HL7 family history can have clinical observation codes which are not mentioned in the appendices; such observations will be ignored. Only the clinical observations with meanings will be used as relevant inputs to the risk models.

The input message must be a valid HL7 Pedigree (Clinical Genomics / Family History) message. If the request message is not HL7 compliant, an <Error/> reply message will be returned, and no further processing will take place. Any namespace schema declarations will be stripped from the source hl7String; they are not used. To actually send the hl7String payload in the SOAP message, be sure to escape any double quote symbols ("") within the message string by preceding them with a backslash character (\). In this fashion, the entire HL7 document parameter is passed as a single string. This author has found that other special characters such as "<" (opening XML tag symbol), for example, do not typically need to be explicitly escaped in the client software, but will likely be escaped/converted automatically by the SOAP software.

Messages

The Risk Service reply message has a small text section at the start of the risk data, and within each risk model's output, which describes any assumptions that were made, such as an age that was used for input to the models when a relative's age or age of onset of cancer is unknown. See Appendix C for an example.

Errors

If a risk model does not run successfully to a normal completion or if a risk model is inapplicable, the portion of the reply message for that model result will contain an “Error” element, with a description of the error (or why the model is not applicable) for the supplied HL7 family history. For example, if the mother of a relative is male, BrcaPro will return this message:

```
<methodCode code="BRCAPRO" codeSystemVersion="2.0-6">
<Error>BayesMendel brcapro message: Error: mother is not female.
You need to contact your software vendor for more information.</Error>
</methodCode>
```

Model Inputs and Imputations

Most risk model input covariate values are required by the respective models, though some model inputs take a value of “Unknown”, a.k.a. “missing”, or “NA”. That is, a value of NA is an allowed input value, built into the design of the model. However, if a model input is required, and it is not available, for certain reasonable situations the Risk Service may attempt to use (impute) an appropriate value. For example, if a relative’s age of onset of breast cancer is missing, the relative’s current age, if alive, or age at death is used. If the relative’s current age is unknown, the age of onset of breast cancer is assumed to be age 50. All assumptions like this will appear in the output message section.

Sometimes risk models take inputs, which, while not directly supplied as clinical observations, are nevertheless computable from multiple other clinical observations using reasonable logic. Here’s an example:

For “CCRAT”, the Colorectal Cancer Risk Assessment Tool, the “NoEstrogen2Yr” (No Estrogen within last two years) input value is determined as follows:

Given the following clinical observation values (only a subset of which may be present):

- HRT Last Use (also used by Tyrer-Cuzick model) = number of years (fractions allowed) since last use of HRT. If more than one HRT Last Use clinicalObservation (CO) in FH, minimum HRT Last Use CO value is used.
- EstroUseFromHRT Status = explicitly codes ‘HRTUseWithinPastTwoYears’ or ‘No HRTUseWithinPastTwoYears’ as would be supplied in answer to that specific survey question
- Menopausal Status (also used by T-C) = pre, peri, post, or unknown (if specified as such, or not present in the FH)
- Menopause Age (also used by T-C) = age at Menopause (applicable only to post Menopausal)
- Date of Last Period = self explanatory, must be compared with ‘effectiveTime’ of HL7 to determine if within 2 years or not

Note that ages can be supplied with a low and high value in the HL7, in which case the average age is calculated, and that more than one clinical observation may be present for the same thing. Normally multiple clinical observations should only be present for a repeated disease at, say, a different age such as for bilateral breast cancer, but HL7 does allow for multiple different clinical observations of the same thing in general. If say, more than one Menopause Age is supplied, the minimum age is used. This is conservative, allowing for the possibility that the pt has no Estrogen in the past two years.

Given all the above inputs, some of which are unknown or not present in the Family History, the algorithm to compute ‘NoEstrogenUse2Yr’ (=’0’ for yes estrogen during last 2 years, or =’1’ for No estrogen during last 2 years) is summarized as follows (this is abbreviated for clarity). Note that this is three valued logic, where any input can have a value or be unknown (NA):

```
NoEstrogenUse2Yr =  
  if (menopausal status equals pre [still having periods]) then '0'  
  else if (last Period date within 2yrs of effectiveTime eq 'yes') then '0'  
  else if ((HRTLastUseValue <= 2) or (EstroUseFromHRTStatus = 'yes')) then '0'  
  
  else if (lastPeriod > 2Yrs From MenopauseAge)) then '1'  
  else if (last Period (from Date provided) Not Within 2 Yrs) then '1'  
  else if (HRTLastUse > 2 yrs) then '1'  
  else if (EstroUseFromHRTStatus = 'no') then '1'  
  else 'NA'
```

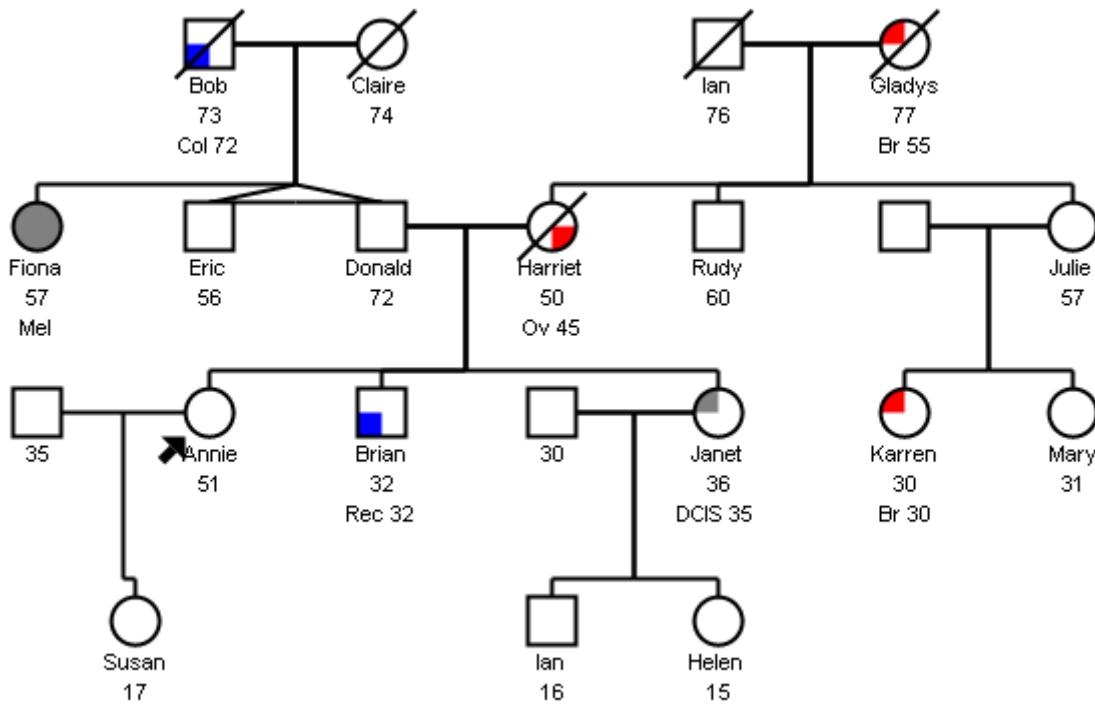

Demo Web Client

A demonstration web client is available at <http://bayesmendel.dfci.harvard.edu/risk>. You may copy/paste any valid input HL7 message or modify an existing sample input HL7 message in the input text area for processing.
