

**Supplemental Figure. Effects of  $\beta$ -catenin on *Dsc* reporter activities.** (a-b) ChIP assays demonstrating binding of  $\beta$ -catenin to the *Dsc3* but not the *Dsc2* promoter. Input, chromatin used for immunoprecipitation; IgG, IP with unspecific IgG. (b-c) Reporter assays in mouse keratinocytes.  $\beta$ -catenin ( $\beta$ Cat), TCF4 and Lef-1 are tested for their ability to affect *Dsc* promoter activities. Baseline reporter activity (set to 1) is defined as the activity of the promoter fragments in the absence of ectopically expressed  $\beta$ Cat, TCF4 or Lef-1. No statistically significant effects of any combination of catenin and TCF/Lef factors on either reporter construct were observed. Error bars, standard deviation.
