

Supplementary Data

SUPPLEMENTARY FIG. S1. Embryonic stem cell (ESC) transduction. ESCs were incubated with lentiviral particles containing the luciferase T-cell factor/lymphoid enhancer-binding factor (TCF/LEF) reporter construct for 24 h at 3 (A), 10 (B), and 25 (C) Multiplicity of Infection (MOI). Selection with puromycin resulted in no transduced colonies from 3 MOI (D), but colonies from 10 MOI (E) and 25 MOI (F) remained after 1 week of puromycin treatment (3 $\mu\text{g}/\text{mL}$). Scale bar = 250 μm .
