Figure S2: Adjusted incidence rates and 95% CIs (shaded areas or whisker plots) of coronary heart disease (left panels), stroke (middle panels), and heart failure (right panels) according to eGFR with 95 ml/min/1.73 m^2 as a reference (diamond) in the reference subgroup of age (A-C), sex (D-F), and race (G-I). Dots represent statistical significance (*P*<0.05). Stars at the bottom of each graph represent significant point-wise interactions (P<0.05) between two subgroups in additive scale. No stars indicate no significant point-wise interaction. Adjustments were for age, sex, race, smoking, history of cardiovascular disease, systolic blood pressure, diabetes, total cholesterol concentration, body mass index, and log-ACR.
