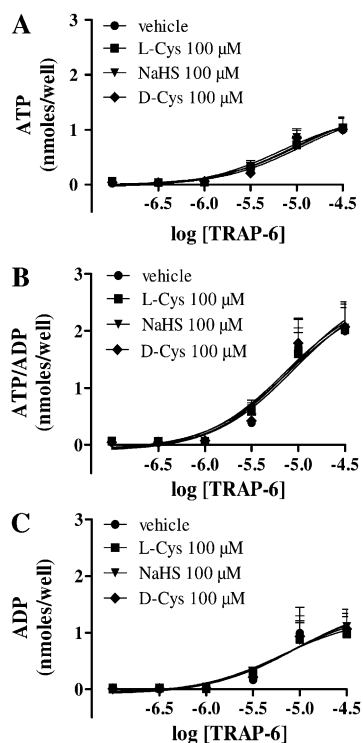

Fig. S1. Measurement of ATP and ADP release from human washed platelets. NaHS (100 μ M), L-Cys (100 μ M), and D-Cys (100 μ M) did not modify (A) ATP, (B) ATP/ADP, or (C) ADP release from washed platelets harvested from healthy volunteers. Results are expressed as nmol per well and calculated as mean \pm SEM from six healthy volunteers. Data were analyzed using one-way ANOVA followed by Dunnett posttest.
