

Supporting Figure S1: Example of fluorescent electrophoretic profiles for diploid (a, b) and tetraploid (c, d) *A. glutinosa* individuals genotyped at 12 microsatellite markers described in Lepais & Bacles (2011). Sized alleles are annotated with squares; size standard peak sizes are indicated above each corresponding peak. Locus names are shown in (a). Note Ag14 is missing in these four individuals probably due to presence of null alleles
