

Figure S5: Micrographs of organisms related to *Bathymodiolus* spp. endosymbionts

Micrographs of MMG1 organisms in surface sediment of the ampharetid habitat (site 309). The cells were stained by the nucleic acid stain DAPI (blue) and a probe that detects the methanotrophic endosymbionts of *Bathymodiolus* spp. and other MMG1 bacteria (probe BMARm-345 - green).
