ABSTRACT

Objectives: Illegal drug use continues to be a major threat to community health and safety. We used international drug surveillance databases to assess the impact of enforcement-based supply reduction strategies on long-term estimates of illegal drug price and purity.

Design: We systematically searched for longitudinal measures of illegal drug supply indicators to assess the long-term impact of enforcement-based supply reduction interventions.

Setting: Data from identified illegal drug surveillance systems were analysed using an *a priori* defined protocol in which we sought to present annual estimates beginning in 1990. Data were then subjected to trend analyses.

Main Outcome Measures: Data were obtained from government surveillance systems assessing price, purity, and/or seizures of illegal drugs; systems with at least 10 years of longitudinal data assessing price, purity/potency, or seizures were included.

Results: We identified 7 surveillance systems with longitudinal measures of price or purity/potency that met eligibility criteria. In the United States, the average inflation- and purity-adjusted prices of heroin, cocaine, and cannabis decreased by 81%, 80% and 86% respectively between 1990 and 2007, whereas average purity increased by 60%, 11%, and 161% respectively. Similar trends were observed in Europe, where during the same period the average inflation-adjusted price of opiates and cocaine decreased by 74% and 51% respectively. In Australia, the average inflation-adjusted price of cocaine decreased 14%, while the inflation-adjusted price of heroin and cannabis both decreased 49% between 2000 and 2010. During this time, seizures of these drugs in major production regions and major domestic markets generally increased.

Conclusions: With few exceptions and despite increasing investments in enforcement-based supply reduction efforts aimed at disrupting global drug supply, illegal drug prices have generally decreased while drug purity has generally increased since 1990. These findings suggest that expanding efforts at controlling the global illegal drug market through law enforcement are failing.

Werb et al. Effectiveness of enforcement-based supply reduction...

Article Summary

Article focus

- Studies have demonstrated that illegal drug use remains a threat to community health and safety.
- However, less is known regarding the long-term impact of efforts to reduce the overall supply of illegal drugs.

Key messages

- Using longitudinal governmental surveillance data, this study demonstrates that over the past two decades, the supply of major illegal drugs has increased, as measured through a general decline in the price, and a general increase in the purity of illegal drugs in a variety of settings.

Strengths and limitations

- This study was limited by the quality and consistency of surveillance data on illegal drug supply
- This study presents over two decades of data on trends in illegal drug supply in a variety of settings, including consumer and export drug markets

Werb et al. Effectiveness of enforcement-based supply reduction...

OBJECTIVES

The United Nations (UN) recently estimated that the global illegal drug trade is worth at least \$350 billion USD annually,¹ and illegal drug use remains a major threat to community health and safety.^{2, 3} In addition to the range of harms associated with the direct health effects of drugs, including fatal overdose,^{4, 5} illegal drug use is also one of the key global drivers of blood borne disease transmission, in particular human immunodeficiency virus (HIV) infection.^{6, 7} Illegal drug markets also contribute to community concerns such as high rates of violence in settings where the trade proliferates.⁸

In response to the health and social concerns associated with illegal drug use, several UN conventions were created to criminalize the possession, consumption, and manufacture of illegal drugs.⁹⁻¹¹ Accordingly, over the last several decades, most national drug control strategies have prioritized drug law enforcement interventions to reduce drug supply, despite recent calls by experts to explore alternative models of drug control.^{12, 13} While some unintended consequences of this approach, such as record incarceration rates, have been well-documented,¹⁴⁻¹⁶ the impact of enforcement-based interventions on drug supply, measured through indicators of drug price, purity/potency and seizures, has not been subjected to systematic evaluation. The present study therefore sought to systematically identify international data from publicly available illegal drug surveillance systems to assess the impact of enforcement-based supply reduction strategies on long-term estimates of illegal drug supply.

Werb et al. Effectiveness of enforcement-based supply reduction...

The primary outcomes of interest were long-term patterns of illegal drug supply, measured through indicators of price and purity/potency for three major illegal drugs: cannabis, cocaine, and opiates (e.g., opium and heroin). Amphetamine-type stimulants were not included given inconsistent data collection (e.g., reclassification) and fluctuating surveillance data quality. A secondary outcome of interest was defined as patterns of illegal drug seizures in a) major illegal drug source regions and, b) major destination markets, as identified by the United Nations Office on Drugs and Crime (UNODC).¹⁷ These secondary outcome data were used as an additional proxy measure to assess the availability of illegal drugs in specific regions, as has been done previously.¹⁸
¹⁹ All outcomes were systematically identified through publicly available illegal drug surveillance systems. Linear by linear association trend tests were carried out on annualized estimates of all outcomes of interest. All price estimates are expressed in 2011 USD and are, where possible, adjusted for purity.²⁰

Illegal drug surveillance systems

A search of illegal drug surveillance systems using two *a priori* defined inclusion criteria was carried out. First, because we specifically sought to assess the long-term impact of enforcement-based supply reduction strategies on illegal drug price and purity/potency, only surveillance systems that included continuous longitudinal assessments of these outcomes of interest for at least 10 years were prioritized for inclusion. Second, data extraction was restricted to 1990 and onwards to focus on patterns of supply during recent decades.

Data were obtained through systematic searches of registries of surveillance systems, governmental reports, and peer-reviewed publications, as

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 well as through data requests to relevant organizations including the UNODC. All
3 authors had complete access to all data and all had final responsibility to submit
4 for publication. Ethics approval was not required given that we relied exclusively
5 on publicly available data.
6
7
8
9
10

11 RESULTS

12 We identified 7 government surveillance systems that met inclusion
13 criteria. Of these, 3 (43%) reported on international data, 3 (43%) reported on
14 data from the United States (US), and 1 (14%) reported on data from Australia.
15 The longest-running surveillance system identified, the US-based Marijuana
16 Potency Monitoring Project, is funded by the U.S. National Institutes of Health
17 and was established in 1975, while the most recent surveillance system was
18 established in 2001 (e.g., the US-based *National Drug Threat Assessment*). With
19 respect to international surveillance systems, the UNODC administers two
20 separate surveillance systems that collect data from all participating United
21 Nations member states: the Annual Reports Questionnaire surveillance system
22 that collects price and purity/potency data, and the Drug Seizures Database that
23 collects seizure data. Finally, the European Monitoring Centre for Drugs and
24 Drug Addiction administers the Reitox drug surveillance system network, which
25 aggregates data from a number of country-level surveillance systems in Europe,
26 as described below.²¹

remained stable or increased overall during the study period. Second, the price of illegal drugs, with few exceptions, generally decreased. Third, seizures of cannabis, cocaine and opiates generally increased in major drug production regions and major domestic markets.

Figure 1 presents data from the US Drug Enforcement Administration's System To Retrieve Information from Drug Evidence (STRIDE). As can be seen, between 1990 and 2007 (the last year for which data are publicly available), the purity of heroin and cocaine, and the potency of cannabis in the US increased, while the inflation- and purity-adjusted prices of these three drugs declined.²² Specifically, heroin purity increased by 60% ($p = 0.568$), cocaine purity increased by 11% ($p = 0.181$), and cannabis potency increased by 161% ($p < 0.001$) during this time. During the same period, the prices of heroin, cocaine, and cannabis decreased 81% ($p < 0.001$), 80% ($p < 0.001$), and 86% ($p < 0.001$) respectively.

Figure 2 presents data collected by the UNODC on the street price of cocaine and opiates in participating European countries (i.e., Austria, Belgium, Denmark, Finland, France, Germany, Greece, Italy, Luxembourg, Netherlands, Norway, Iceland, Portugal, Spain, Sweden, Switzerland, United Kingdom, and Ireland).²³ In these countries, between 1990 and 2009, the aggregate average retail street price of cocaine decreased by 51%, from \$198 USD per gram to \$98 USD per gram ($p < 0.001$). Similarly, the aggregate average price of opiates in Europe decreased 74%, from a high of \$295 USD per gram in 1990 to \$77 USD per gram in 2009 ($p < 0.001$).

Data from the Australian Illicit Drug Reporting System (IDRS) were available from 2000 to 2010. IDRS data suggest that the price of illegal drugs in

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 Australia fluctuated substantially during this period. Specifically, after adjustment,
3 the price of heroin decreased by 49%, from approximately \$460 USD per gram to
4 approximately \$235 per gram ($p < 0.001$), the price of cocaine decreased 14%
5 from approximately \$255 AUD per gram to \$220 AUD per gram ($p = 0.477$), and
6 the price of cannabis decreased 49% from approximately \$25 AUD per gram to
7 \$13 AUD per gram ($p < 0.001$).²⁴

16 **Seizures**

17 *Domestic Markets*

18
19
20
21 Figure 3 presents data on cannabis and cocaine seizures in the US
22 between 1990 and 2010. As shown, data from the US Drug Enforcement
23 Administration's STRIDE surveillance system demonstrate that the amount of
24 cannabis herb seized by the Drug Enforcement Administration both in, and
25 destined for, the US rose 465%, from approximately 130,000 kilograms in 1990
26 to approximately 720,000 kilograms in 2010 ($p < 0.001$). During this same period,
27 despite fluctuations, the amount of cocaine seized by the US Drug Enforcement
28 Administration decreased 49%, from approximately 57,000 kilograms in 1990 to
29 29,000 in 2010 ($p = 0.409$), while the amount of heroin seized increased 29%
30 from approximately 535 kilograms in 1990 to 690 kilograms ($p = 0.979$, heroin
31 seizure data not shown).²⁵

48 Figure 4 presents data on cannabis, cocaine and heroin seizures in
49 countries participating in the European Monitoring Centre for Drugs and Drug
50 Addiction's Reitox surveillance network (i.e., European Union member countries,
51 as well as Croatia, Norway, and Turkey), between 1995 and 2009. As can be
52 seen, annual estimates of the quantity of both cocaine and cannabis seized
53
54
55
56
57
58
59
60

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 fluctuated throughout this period; however, the quantity of heroin seized
3 increased relatively steadily. Specifically, the number of kilograms of cannabis
4 herb seized was at a low of approximately 57,000 kilograms in 1995, and peaked
5 one year later in 1996 at approximately 138,000 kilograms ($p = 0.446$). The
6 number of cocaine seizures was at a low of approximately 21,000 kilograms in
7 1995, and peaked at approximately 121,000 kilograms in 2006 ($p = 0.018$).
8 Finally, the number of kilograms of heroin seized increased 380% from a low of
9 approximately 5,000 in 1995 to a high of approximately 24,000 in 2009 ($p <$
10 0.001).

24 *Production Regions*

25
26 With respect to opiate seizures, the Golden Triangle includes parts of
27 Thailand, Lao, Viet Nam and Myanmar, and according to the UNODC, this region
28 is the second largest supplier of heroin globally.²⁶ Here, seizures of opium more
29 than doubled from 3,198 kilograms in 1990 to 8,903 kilograms in 2006 ($p =$
30 0.430), the last year for which this data is available. By contrast, seizures of
31 heroin decreased by more than half, from 1,337 kilograms in 1990, to 569
32 kilograms in 2006 ($p = 0.339$). In Afghanistan, which is believed to supply over
33 90% of the world's opium,²⁶ seizures of opium increased by close to 9,000%,
34 from 453 kilograms in 1990 to 40,959 kilograms in 2006, and seizures of heroin
35 increased by approximately 220%, from 1,256 kilograms in 1990 to 4,053
36 kilograms in 2006 (Note: missing data prevented a trend test for annual opium
37 and heroin seizures in Afghanistan).

41
42
43
44
45
46
47
48
49
50
51
52
53

54 With respect to cocaine seizures, according to the UNODC, Latin
55 America's Andean region, which includes Peru, Bolivia, and Colombia, is the
56
57
58
59
60

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 primary global supplier of this drug, as coca leaf is grown exclusively in this
4
5 region.²⁷ While seizures of cocaine in the Andean region decreased 81%, from
6
7 97,437 kilograms in 1990 to 17,835 kilograms in 2007 ($p = 0.028$), seizures of
8
9 coca leaf increased 188% from 601,038 kilograms in 1990 to 1.73 million
10
11 kilograms ($p = 0.004$).
12
13

14 Finally, according to the UNODC, cannabis is produced in all global
15
16 regions, though major areas of cannabis cultivation exist in North Africa,
17
18 Afghanistan, and North America. These areas are net exporters of cannabis,
19
20 though most cannabis-producing countries also produce the drug for internal
21
22 consumption.¹⁷ In North Africa (i.e., Algeria, Morocco, and Tunisia), seizures of
23
24 cannabis herb increased by 208% from 67,930 kilograms in 1990 to 209,445
25
26 kilograms in 2007 ($p = 0.015$). In North America (i.e., Canada, the United States,
27
28 and Mexico), seizures of cannabis herb increased by 288% from 782,607
29
30 kilograms in 1990 to 3.05 million kilograms in 2007 ($p < 0.001$). In Afghanistan,
31
32 while data on cannabis herb seizures are not available, seizures of cannabis
33
34 resin increased 630% from 5,068 kilograms in 1990 to 36,972 kilograms in 2006
35
36 ($p = 0.061$).
37
38
39
40
41

42 CONCLUSIONS

43
44
45 Longitudinal data from government surveillance systems demonstrate that
46
47 over the past two decades there has been a general pattern of increased illegal
48
49 drug supply as defined through lower price and higher purity of heroin, cocaine
50
51 and cannabis. During the same period, patterns of drug seizures either increased
52
53 or remained stable, though the trends detected in some of these indicators did
54
55 not reach statistical significance.

Werb et al. Effectiveness of enforcement-based supply reduction...

As noted elsewhere,^{28, 29} there are limitations of ecologic analyses based on international surveillance systems. First, some states collect little or no data on indicators of illegal drug supply, whereas other states spend significant energy on monitoring drug availability. Second, even in states that closely track indicators of supply, the degree to which seized samples of illegal drugs reflect purity of retail drugs sold on the street is subject to variation, though where possible we presented purity-adjusted prices to address this limitation.²⁰ Nevertheless, the long-term trends in increasing purity and decreasing price presented here likely reflect overall trends in many regions, though some exceptions were observed. Australia for instance, while experiencing a significant decrease in the prices of both heroin and cannabis, did not experience a significant decrease in the price of cocaine, which may reflect the geographic isolation of the region or other market factors. Third, limitations in longitudinal data collection precluded our ability to include amphetamine-type stimulants and other emerging synthetic substances. It is noteworthy in this regard that the production of synthetic substances present particular challenges for supply reduction strategies, given that these drugs can be mass produced in clandestine locations regardless of climate or other factors that limit traditional drug production.^{17, 30} Finally, while this review focused on the impact of enforcement-based supply reductions on price and purity of selected illegal drugs, these measures are only a marker of drug supply, and do not measure other factors determining availability and concomitant rates of drug use. It is noteworthy in this regard that a recent World Health Organization report that assessed data from a combined sample of over 85,000 participants in 17 countries found no

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 association between the intensity of national drug law enforcement and rates of
4
5 drug use.³¹
6

7
8 In summary, longitudinal illegal drug surveillance systems demonstrate a
9
10 general global pattern of falling drug prices and increasing drug purity and
11
12 potency, alongside a relatively consistent pattern of increasing seizures of illegal
13
14 drugs. Although source data have limitations and there are some exceptions to
15
16 these trends, these findings highlight the need to re-examine the effectiveness of
17
18 national and international drug strategies that place a disproportionate emphasis
19
20 on supply reduction at the expense of prevention and treatment of illegal drug
21
22 use.

Dear Dr. Groves and Colleagues:

As you are surely aware, there has been an increasing focus by scientists and policymakers on evaluating the effectiveness of law enforcement-based interventions for controlling illicit drugs. However, despite a wealth of governmental surveillance data on indicators of drug supply (e.g., the price and purity of illicit drugs), few published studies subject these data to longitudinal analyses. As such, the enclosed manuscript presents analyses of international trends in the supply of major illicit drugs over the past two decades, as measured through governmental surveillance data on the price and purity of illicit drugs, as well as on levels of illicit drug seizures in major drug production zones and destination markets.

Given the current international debate regarding the effectiveness of current drug policy approaches, we believe that the publication of the enclosed manuscript will be of high interest to your readership. As is customary, this letter will certify that the enclosed article is not being considered for publication elsewhere. This letter also certifies if the enclosed manuscript is acceptable, we will turn copyright over to *BMJ Open*.

Thank you for your consideration.

Yours sincerely,

Evan Wood, MD, PhD ABIM FRCPC

ABSTRACT

Objectives: Illegal drug use continues to be a major threat to community health and safety. We used international drug surveillance databases to assess the **relationship between multiple** long-term estimates of illegal drug price and purity.

Design: We systematically searched for longitudinal measures of illegal drug supply indicators to assess the long-term impact of enforcement-based supply reduction interventions.

Setting: Data from identified illegal drug surveillance systems were analysed using an *a priori* defined protocol in which we sought to present annual estimates beginning in 1990. Data were then subjected to trend analyses.

Main Outcome Measures: Data were obtained from government surveillance systems assessing price, purity, and/or seizure quantities of illegal drugs; systems with at least 10 years of longitudinal data assessing price, purity/potency, or seizures were included.

Results: We identified 7 regional/international meta-surveillance systems with longitudinal measures of price or purity/potency that met eligibility criteria. In the United States, the average inflation- and purity-adjusted prices of heroin, cocaine, and cannabis decreased by 81%, 80% and 86% respectively between 1990 and 2007, whereas average purity increased by 60%, 11%, and 161% respectively. Similar trends were observed in Europe, where during the same period the average inflation-adjusted price of opiates and cocaine decreased by 74% and 51% respectively. In Australia, the average inflation-adjusted price of cocaine decreased 14%, while the inflation-adjusted price of heroin and cannabis both decreased 49% between 2000 and 2010. During this time, seizures of these drugs in major production regions and major domestic markets generally increased.

Conclusions: With few exceptions and despite increasing investments in enforcement-based supply reduction efforts aimed at disrupting global drug supply, illegal drug prices have generally decreased while drug purity has generally increased since 1990. These findings suggest that expanding efforts at controlling the global illegal drug market through law enforcement are failing.

Werb et al. Effectiveness of enforcement-based supply reduction...

Article Summary

Article focus

- Studies have demonstrated that illegal drug use remains a threat to community health and safety.
- However, less is known regarding the long-term impact of efforts to reduce the overall supply of illegal drugs.

Key messages

- Using longitudinal governmental surveillance data, this study demonstrates that over the past two decades, the supply of major illegal drugs has increased, as measured through a general decline in the price, and a general increase in the purity of illegal drugs in a variety of settings.

Strengths and limitations

- This study was limited by the quality and consistency of surveillance data on illegal drug supply
- This study presents data on trends in illegal drug supply in a variety of settings **over two decades**, including consumer and export drug markets

Werb et al. Effectiveness of enforcement-based supply reduction...

OBJECTIVES

The United Nations (UN) recently estimated that the global illegal drug trade is worth at least \$350 billion USD annually,¹ and illegal drug use remains a major threat to community health and safety.^{2, 3} In addition to the range of harms associated with the direct health effects of drugs, including fatal overdose,^{4, 5} illegal drug use is also one of the key global drivers of blood borne disease transmission, in particular human immunodeficiency virus (HIV) infection.^{6, 7} Illegal drug markets also contribute to community concerns such as high rates of violence in settings where the trade proliferates.⁸

In response to the health and social concerns associated with illegal drug use, several UN conventions were created to control the possession, consumption, and manufacture of illegal drugs.⁹⁻¹¹ As a result, over the last several decades, most national drug control strategies have prioritized drug law enforcement interventions to reduce drug supply, despite recent calls by experts to explore alternative models of drug control such as systems of drug decriminalization and legal regulation.¹²⁻¹⁴ Some unintended consequences of this approach, such as record incarceration rates, have been well-documented.¹⁵⁻¹⁸ Additionally, a small number of studies assessing aspects of drug supply, measured through indicators of drug price, purity/potency and seizures, have been undertaken to describe the global relationship between these indicators over the long-term.¹⁹ However, systematic evaluation of these relationships is still needed to elucidate patterns of drug supply. The present study therefore sought to systematically identify international data from publicly available illegal drug surveillance systems to assess long-term estimates of illegal drug supply.

Werb et al. Effectiveness of enforcement-based supply reduction...

DESIGN

Outcomes of interest

The primary outcomes of interest were long-term patterns of illegal drug supply, measured through indicators of price and purity/potency for three major illegal drugs: cannabis, cocaine, and opiates (e.g., opium and heroin). While data on amphetamine-type stimulants exist in some specific countries (e.g., the United Kingdom), this class of drugs was not included given inconsistent data collection and classification, and fluctuating surveillance periods and overall data quality. A secondary outcome of interest was data on illegal drug seizures in a) major illegal drug source regions and, b) major destination markets, as identified by the United Nations Office on Drugs and Crime (UNODC).²⁰ These secondary outcome data were used as an additional proxy measure to assess the availability of illegal drugs in specific regions, as has been done previously.^{21, 22} All outcomes were systematically identified through publicly available illegal drug surveillance systems. Linear by linear association trend tests were carried out on annualized estimates of all outcomes of interest. All price estimates are expressed in 2011 USD and are, where possible, adjusted for purity.²³

Illegal drug surveillance systems

An online search of surveillance systems monitoring illegal drugs using two *a priori* defined inclusion criteria was carried out. First, because we specifically sought to assess the long-term impact of enforcement-based supply reduction strategies on illegal drug price and purity/potency, only surveillance systems that included continuous longitudinal assessments of these outcomes of interest for at least 10 years were prioritized for inclusion. Second, data

extraction was restricted to 1990 and onwards to focus on patterns of supply during recent decades.

Data were obtained through systematic searches of registries of surveillance systems (e.g., governmental websites, United Nations databases), governmental reports, and peer-reviewed publications, as well as through data requests to relevant organizations including the UNODC. All authors had complete access to all data and all had final responsibility to submit for publication. Ethics approval was not required given that we relied exclusively on publicly available data.

RESULTS

We identified 7 government surveillance systems that met inclusion criteria. Of these, 3 (43%) reported on international data, 3 (43%) reported on data from the United States (US), and 1 (14%) reported on data from Australia. One of the longest-running surveillance system identified, the US-based Marijuana Potency Monitoring Project, is funded by the U.S. National Institutes of Health and was established in 1975, while the most recent surveillance system was established in 2001 (e.g., the US-based *National Drug Threat Assessment*). With respect to international surveillance systems, the UNODC administers two separate surveillance systems that collect data from all participating United Nations member states: the Annual Reports Questionnaire surveillance system that collects price and purity/potency data, and the Drug Seizures Database that collects seizure data. Finally, the European Monitoring Centre for Drugs and Drug Addiction administers the Reitox drug surveillance system network, which

Werb et al. Effectiveness of enforcement-based supply reduction...

aggregates data from a number of country-level surveillance systems in Europe, as described below.²⁴

Price and Purity/Potency

Table 1 presents surveillance systems that matched search criteria. An assessment of data provided by these surveillance systems demonstrated a number of broad trends. First, purity and/or potency of illegal drugs generally remained stable or increased overall during the study period. Second, the price of illegal drugs, with few exceptions, generally decreased. Third, seizures of cannabis, cocaine and opiates generally increased in major drug production regions and major domestic markets.

Figure 1 presents data from the US Drug Enforcement Administration's System To Retrieve Information from Drug Evidence (STRIDE). As can be seen, between 1990 and 2007 (the last year for which data are publicly available), the purity of heroin and cocaine, and the potency of cannabis herb in the US increased, while the inflation- and purity-adjusted retail street prices of these three drugs declined.²⁵ Specifically, heroin purity increased by 60% ($p = 0.568$), cocaine purity increased by 11% ($p = 0.181$), and cannabis herb potency increased by 161% ($p < 0.001$) during this time. During the same period, the prices of heroin, cocaine, and cannabis decreased 81% ($p < 0.001$), 80% ($p < 0.001$), and 86% ($p < 0.001$) respectively.

Figure 2 presents data collected by the UNODC on the street price of cocaine and opiates in participating European countries (i.e., Austria, Belgium, Denmark, Finland, France, Germany, Greece, Italy, Luxembourg, Netherlands, Norway, Iceland, Portugal, Spain, Sweden, Switzerland, United Kingdom, and

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 Ireland).²⁶ In these countries, between 1990 and 2009, the aggregate average
4
5 retail street price of cocaine decreased by 51%, from \$198 USD per gram to \$98
6
7 USD per gram ($p < 0.001$). Similarly, the aggregate average price of opiates in
8
9 Europe decreased 74%, from a high of \$295 USD per gram in 1990 to \$77 USD
10
11 per gram in 2009 ($p < 0.001$).
12
13

14 Data from the Australian Illicit Drug Reporting System (IDRS) were
15
16 available from 2000 to 2010. IDRS data suggest that the price of illegal drugs in
17
18 Australia fluctuated substantially during this period. Specifically, after adjustment,
19
20 the price of heroin decreased by 49%, from approximately \$460 USD per gram to
21
22 approximately \$235 per gram ($p < 0.001$), despite the well-described heroin
23
24 'drought' of 2001,²⁷ which saw a reduction in the supply and availability of heroin
25
26 in Australia. Additionally, the price of cocaine decreased 14% from approximately
27
28 \$255 AUD per gram to \$220 AUD per gram ($p = 0.477$), and the price of
29
30 cannabis decreased 49% from approximately \$25 AUD per gram to \$13 AUD per
31
32 gram ($p < 0.001$).²⁸

38 **Seizures**

39 *Domestic Markets*

40
41
42 Figure 3 presents data on cannabis and cocaine seizures in the US
43
44 between 1990 and 2010. As shown, data from the US Drug Enforcement
45
46 Administration's STRIDE surveillance system demonstrate that the amount of
47
48 cannabis herb seized by the Drug Enforcement Administration both in, and
49
50 destined for, the US rose 465%, from approximately 130,000 kilograms in 1990
51
52 to approximately 720,000 kilograms in 2010 ($p < 0.001$). During this same period,
53
54 despite fluctuations, the amount of cocaine seized by the US Drug Enforcement

Administration decreased 49%, from approximately 57,000 kilograms in 1990 to 29,000 in 2010 ($p = 0.409$), while the amount of heroin seized increased 29% from approximately 535 kilograms in 1990 to 690 kilograms ($p = 0.979$, heroin seizure data not shown).²⁹

Figure 4 presents data on cannabis, cocaine and heroin seizures in countries participating in the European Monitoring Centre for Drugs and Drug Addiction's Reitox surveillance network (i.e., European Union member countries, as well as Croatia, Norway, and Turkey), between 1995 and 2009. As can be seen, annual estimates of the quantity of both cocaine and cannabis herb seized fluctuated throughout this period; however, the quantity of heroin seized increased relatively steadily. Specifically, the number of kilograms of cannabis herb seized was at a low of approximately 57,000 kilograms in 1995, and peaked one year later in 1996 at approximately 138,000 kilograms ($p = 0.446$). The number of cocaine seizures was at a low of approximately 21,000 kilograms in 1995, and peaked at approximately 121,000 kilograms in 2006 ($p = 0.018$). Finally, the number of kilograms of heroin seized increased 380% from a low of approximately 5,000 in 1995 to a high of approximately 24,000 in 2009 ($p < 0.001$).

Production Regions

With respect to opiate seizures, the Golden Triangle includes parts of Thailand, Lao, Viet Nam and Myanmar, and according to the UNODC, this region is the second largest supplier of heroin globally, though production has declined throughout the last decade, with opium production decreasing by approximately 60% and 90% in Myanmar and Lao, respectively.³⁰ In this region, trends in

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2 seizures of opium have fluctuated; 3,198 kilograms of opium were seized in
3
4
5 1990, with a high of 12,462 kilograms seized in 2007 before a steep decline to
6
7 1,225 kilograms in 2010 ($p = 0.856$). Similarly, seizures of heroin fluctuated, with
8
9 a decrease of more than half, from 1,337 kilograms in 1990, to 627 kilograms in
10
11 2010 ($p = 0.085$), and a peak of 1,565 kilograms seized in 2009. In Afghanistan,
12
13 which is believed to supply over 90% of the world's opium,³⁰ seizures of raw and
14
15 prepared opium increased by over 12,000%, from 453 kilograms in 1990 to
16
17 57,023 kilograms in 2010, and seizures of heroin increased by over 600%, from
18
19 1,256 kilograms in 1990 to 9,036 kilograms in 2010 (Note: missing data
20
21 prevented a trend test for annual opium and heroin seizures in Afghanistan).
22
23
24

25
26 With respect to cocaine seizures, according to the UNODC, Latin
27
28 America's Andean region, which includes Peru, Bolivia, and Colombia, is the
29
30 primary global supplier of this drug, as coca leaf is grown exclusively in this
31
32 region.³¹ While seizures of cocaine in the Andean region decreased 81%, from
33
34 97,437 kilograms in 1990 to 17,835 kilograms in 2007 ($p = 0.028$), seizures of
35
36 coca leaf increased 188% from 601,038 kilograms in 1990 to 1.73 million
37
38 kilograms in 2007 ($p = 0.004$). During the same period, the area of coca
39
40 cultivation in this region declined slightly, from approximately 210,000 hectares to
41
42 180,000 hectares ($p = 0.004$).
43
44
45
46

47
48 Finally, according to the UNODC, major areas of cannabis cultivation exist
49
50 in North Africa, Afghanistan, and North America. These areas are net exporters
51
52 of cannabis, though most cannabis-producing countries also produce the drug for
53
54 internal consumption.²⁰ In North Africa (i.e., Algeria, Morocco, and Tunisia),
55
56 seizures of cannabis herb increased by 208% from 67,930 kilograms in 1990 to
57
58
59
60

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 209,445 kilograms in 2007 ($p = 0.015$). In North America (i.e., Canada, the
3 United States, and Mexico), seizures of cannabis herb increased by 288% from
4 782,607 kilograms in 1990 to 3.05 million kilograms in 2007 ($p < 0.001$). In
5 Afghanistan, while data on cannabis herb seizures are not available, seizures of
6 cannabis resin increased 630% from 5,068 kilograms in 1990 to 36,972
7 kilograms in 2006 ($p = 0.061$).

21 **CONCLUSIONS**

22
23
24 Longitudinal data from government surveillance systems demonstrate that
25 over the past two decades there has been a general pattern of increased illegal
26 drug supply as defined through lower price and higher purity of heroin, cocaine
27 and cannabis. During the same period, patterns of drug seizures either increased
28 or remained stable, though the trends detected in some of these indicators did
29 not reach statistical significance. As such, we conclude, consistent with previous
30 studies,¹⁹ that the global supply of illicit drugs has likely not been reduced in the
31 previous two decades. In particular, the data presented in this study suggest that
32 the supply of opiates and cannabis, in particular, have increased, given the
33 increasing potency and decreasing prices of these illegal commodities. These
34 results have implications for the development of evidence-based drug policies,
35 particularly given the interest in novel drug policy approaches in a number of
36 settings in Latin America, North America, and Europe.³²⁻³⁴

44
45
46
47
48
49
50
51
52
53

54 As noted elsewhere,^{35, 36} there are limitations of ecologic analyses based
55 on international surveillance systems. First, some states collect little or no data
56
57
58
59
60

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 on indicators of illegal drug supply, whereas other states spend significant energy
4
5 on monitoring drug availability. Second, even in states that closely track
6
7 indicators of supply, the degree to which seized samples of illegal drugs reflect
8
9 purity of retail drugs sold on the street is subject to variation, though where
10
11 possible we presented purity-adjusted prices to address this limitation.²³
12
13 Nevertheless, the long-term trends in increasing purity and decreasing price
14
15 presented here likely reflect overall trends in many regions, though it should be
16
17 noted that in some regions (e.g., Europe), indicators of price and purity may have
18
19 been strongly influenced by a few countries such as the United Kingdom and
20
21 Spain. Additionally, some exceptions in the trends were observed. Australia for
22
23 instance, while experiencing a significant decrease in the prices of both heroin
24
25 and cannabis, did not experience a significant decrease in the price of cocaine,
26
27 which may reflect the geographic isolation of the region or other market factors. It
28
29 is also of note that Australia's 'heroin drought',³⁷ which saw a sudden drop in
30
31 measures of the supply and availability of heroin, appears to have had a limited
32
33 long-term impact on supply, though some experts suggest that it may have
34
35 resulted in higher levels of polysubstance use among Australian heroin
36
37 injectors.²⁷ Third, limitations in longitudinal data collection precluded our ability to
38
39 include amphetamine-type stimulants and other emerging synthetic substances,
40
41 as this data is limited to certain countries and the focus of this study was on
42
43 regional trends. It is noteworthy in this regard that the production of synthetic
44
45 substances – as well as indoor cannabis cultivation – present particular
46
47 challenges for supply reduction strategies, given that these drugs can be mass
48
49 produced in clandestine locations regardless of climate or other factors that limit

traditional drug production.^{20, 38} Finally, while this review focused on patterns of price and purity of selected illegal drugs, these measures are only a marker of drug supply, and do not measure other factors determining availability and concomitant rates of drug use. These limitations to assessing global drug supply using classic proxy measures such as price, purity, and, to a lesser extent, seizures, suggests that there may be a need to expand the range of measures systematically collected by governments and international bodies such as the UNODC and the European Monitoring Centre for Drugs and Drug Addiction. In particular, meaningfully incorporating measures derived from street-level questionnaires of people who use drugs may provide a more reliable metric of supply and availability. Indeed, some bodies, such as Australia's IDRS, collect such data,²⁸ and this methodological approach should be considered by those coordinating surveillance of illegal drugs. Other bodies have also prioritized emphasizing measures of community health including reduced HIV infections, reduced drug-related violence and reductions in numbers of individuals incarcerated.^{39, 40}

In summary, longitudinal illegal drug surveillance systems demonstrate a general global pattern of falling drug prices and increasing drug purity and potency, alongside a relatively consistent pattern of increasing seizures of illegal drugs. Although source data have limitations and there are some exceptions to these trends, these findings should be useful given the current debates and drug policy experimentation under way in Latin America, North America, and Europe.³²⁻³⁴ It is hoped that this study highlights the need to re-examine the effectiveness of national and international drug strategies that place a

Werb et al. Effectiveness of enforcement-based supply reduction...

disproportionate emphasis on supply reduction at the expense of evidence-based prevention and treatment of problematic illegal drug use.

Table 1: Major Illegal Drug Data Surveillance Systems

| Surveillance system | Country/Region | Inception Date | Illegal drugs considered | | | Outcomes considered | | | | Summary of findings |
|---|----------------|----------------|--------------------------|---------|--------|---------------------|--------|-----|----------|--|
| | | | cannabis | cocaine | heroin | Price | Purity | Use | Seizures | |
| University of Mississippi Marijuana Project | USA | 1975 - | X | | | | X | | | Cannabis potency increased between 1990 and 2009. |
| STRIDE Surveillance System | USA | 1986- | X | X | X | X | X | | | Price decreased and purity/potency increased across all illegal drugs considered. |
| UNODC Drug Seizures Database | International | 1980 - | X | X | X | | | | X | Seizures of all drugs have increased between 1995 and 2006. |
| UNODC Annual Reports Questionnaire | International | 1990 - | X | X | X | X | X | X | | Prices of opiates, cocaine, and cannabis have generally decreased in Europe and the US while purity and potency have increased. |
| Reitox (EMCDDA database) | Europe | 1993 - | X | X | X | X | | | X | Price of all illegal substances decreased in 2002 to 2007. Cocaine, cannabis, and heroin seizures increased between 2002 and 2007. |
| Illicit Drug Reporting System | Australia | 2000 - | X | X | X | X | X | | X | Between 2000 and 2010, the price of cocaine, cannabis and heroin decreased, while perceived purity remained stable. |
| National Drug Threat Assessment | USA | 2001 - | X | X | X | X | | | X | Between 2005 and 2009, cocaine purity decreased whereas price increased. |

Werb et al. Effectiveness of enforcement-based supply reduction...

ABSTRACT

Objectives: Illegal drug use continues to be a major threat to community health and safety. We used international drug surveillance databases to assess the **relationship between multiple** long-term estimates of illegal drug price and purity.

Design: We systematically searched for longitudinal measures of illegal drug supply indicators to assess the long-term impact of enforcement-based supply reduction interventions.

Setting: Data from identified illegal drug surveillance systems were analysed using an *a priori* defined protocol in which we sought to present annual estimates beginning in 1990. Data were then subjected to trend analyses.

Main Outcome Measures: Data were obtained from government surveillance systems assessing price, purity, and/or seizure **quantities** of illegal drugs; systems with at least 10 years of longitudinal data assessing price, purity/potency, or seizures were included.

Results: We identified 7 **regional/international meta-surveillance** systems with longitudinal measures of price or purity/potency that met eligibility criteria. In the United States, the average inflation- and purity-adjusted prices of heroin, cocaine, and cannabis decreased by 81%, 80% and 86% respectively between 1990 and 2007, whereas average purity increased by 60%, 11%, and 161% respectively. Similar trends were observed in Europe, where during the same period the average inflation-adjusted price of opiates and cocaine decreased by 74% and 51% respectively. In Australia, the average inflation-adjusted price of cocaine decreased 14%, while the inflation-adjusted price of heroin and cannabis both decreased 49% between 2000 and 2010. During this time, seizures of these drugs in major production regions and major domestic markets generally increased.

Conclusions: With few exceptions and despite increasing investments in enforcement-based supply reduction efforts aimed at disrupting global drug supply, illegal drug prices have generally decreased while drug purity has generally increased since 1990. These findings suggest that expanding efforts at controlling the global illegal drug market through law enforcement are failing.

Werb et al. Effectiveness of enforcement-based supply reduction...

Article Summary

Article focus

- Studies have demonstrated that illegal drug use remains a threat to community health and safety.
- However, less is known regarding the long-term impact of efforts to reduce the overall supply of illegal drugs.

Key messages

- Using longitudinal governmental surveillance data, this study demonstrates that over the past two decades, the supply of major illegal drugs has increased, as measured through a general decline in the price, and a general increase in the purity of illegal drugs in a variety of settings.

Strengths and limitations

- This study was limited by the quality and consistency of surveillance data on illegal drug supply
- This study presents data on trends in illegal drug supply in a variety of settings **over two decades**, including consumer and export drug markets

Werb et al. Effectiveness of enforcement-based supply reduction...

OBJECTIVES

The United Nations (UN) recently estimated that the global illegal drug trade is worth at least \$350 billion USD annually,¹ and illegal drug use remains a major threat to community health and safety.^{2, 3} In addition to the range of harms associated with the direct health effects of drugs, including fatal overdose,^{4, 5} illegal drug use is also one of the key global drivers of blood borne disease transmission, in particular human immunodeficiency virus (HIV) infection.^{6, 7} Illegal drug markets also contribute to community concerns such as high rates of violence in settings where the trade proliferates.⁸

In response to the health and social concerns associated with illegal drug use, several UN conventions were created to **control** the possession, consumption, and manufacture of illegal drugs.⁹⁻¹¹ **As a result**, over the last several decades, most national drug control strategies have prioritized drug law enforcement interventions to reduce drug supply, despite recent calls by experts to explore alternative models of drug control **such as systems of drug decriminalization and legal regulation.**¹²⁻¹⁴ Some unintended consequences of this approach, such as record incarceration rates, have been well-documented.¹⁵⁻¹⁸ **Additionally, a small number of studies assessing aspects of drug supply, measured through indicators of drug price, purity/potency and seizures, have been undertaken to describe the global relationship between these indicators over the long-term.**¹⁹ However, **systematic evaluation of these relationships is still needed to elucidate patterns of drug supply.** The present study therefore sought to systematically identify international data from

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 publicly available illegal drug surveillance systems to assess long-term estimates
3 of illegal drug supply.
4
5
6

7 DESIGN

8 ***Outcomes of interest***

9
10 The primary outcomes of interest were long-term patterns of illegal drug
11 supply, measured through indicators of price and purity/potency for three major
12 illegal drugs: cannabis, cocaine, and opiates (e.g., opium and heroin). **While**
13 **data on amphetamine-type stimulants exist in some specific countries (e.g.,**
14 **the United Kingdom), this class of drugs was not included given**
15 **inconsistent data collection and classification, and fluctuating surveillance**
16 **periods and overall data quality.** A secondary outcome of interest was **data on**
17 **illegal drug seizures in a) major illegal drug source regions and, b) major**
18 **destination markets, as identified by the United Nations Office on Drugs and**
19 **Crime (UNODC).²⁰ These secondary outcome data were used as an additional**
20 **proxy measure to assess the availability of illegal drugs in specific regions, as**
21 **has been done previously.^{21, 22} All outcomes were systematically identified**
22 **through publicly available illegal drug surveillance systems. Linear by linear**
23 **association trend tests were carried out on annualized estimates of all outcomes**
24 **of interest. All price estimates are expressed in 2011 USD and are, where**
25 **possible, adjusted for purity.²³**

46
47
48
49

50 ***Illegal drug surveillance systems***

51
52 **An online search of surveillance systems monitoring illegal drugs**
53 **using two a priori defined inclusion criteria was carried out.** First, because
54 we specifically sought to assess the long-term impact of enforcement-based
55
56
57
58
59
60

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 supply reduction strategies on illegal drug price and purity/potency, only
3 surveillance systems that included continuous longitudinal assessments of these
4 outcomes of interest for at least 10 years were prioritized for inclusion. Second,
5 data extraction was restricted to 1990 and onwards to focus on patterns of supply
6 during recent decades.
7
8
9
10
11
12

13
14 **Data were obtained through systematic searches of registries of**
15 **surveillance systems (e.g., governmental websites, United Nations**
16 **databases),** governmental reports, and peer-reviewed publications, as well as
17 through data requests to relevant organizations including the UNODC. All authors
18 had complete access to all data and all had final responsibility to submit for
19 publication. Ethics approval was not required given that we relied exclusively on
20 publicly available data.
21
22
23
24
25
26
27
28
29

30 **RESULTS**

31
32 We identified 7 government surveillance systems that met inclusion
33 criteria. Of these, 3 (43%) reported on international data, 3 (43%) reported on
34 data from the United States (US), and 1 (14%) reported on data from Australia.
35
36 **One of the** longest-running surveillance system identified, the US-based
37 Marijuana Potency Monitoring Project, is funded by the U.S. National Institutes of
38 Health and was established in 1975, while the most recent surveillance system
39 was established in 2001 (e.g., the US-based *National Drug Threat Assessment*).
40
41 With respect to international surveillance systems, the UNODC administers two
42 separate surveillance systems that collect data from all participating United
43 Nations member states: the Annual Reports Questionnaire surveillance system
44 that collects price and purity/potency data, and the Drug Seizures Database that
45
46

1
2
3 collects seizure data. Finally, the European Monitoring Centre for Drugs and
4
5 Drug Addiction administers the Reitox drug surveillance system network, which
6
7 aggregates data from a number of country-level surveillance systems in Europe,
8
9 as described below.²⁴

11 **Price and Purity/Potency**

12
13
14 Table 1 presents surveillance systems that matched search criteria. An
15
16 assessment of data provided by these surveillance systems demonstrated a
17
18 number of broad trends. First, purity and/or potency of illegal drugs generally
19
20 remained stable or increased overall during the study period. Second, the price of
21
22 illegal drugs, with few exceptions, generally decreased. Third, seizures of
23
24 cannabis, cocaine and opiates generally increased in major drug production
25
26 regions and major domestic markets.
27
28
29

30
31 Figure 1 presents data from the US Drug Enforcement Administration's
32
33 System To Retrieve Information from Drug Evidence (STRIDE). As can be seen,
34
35 between 1990 and 2007 (the last year for which data are publicly available), the
36
37 purity of heroin and cocaine, and the potency of cannabis **herb** in the US
38
39 increased, while the inflation- and purity-adjusted **retail street** prices of these
40
41 three drugs declined.²⁵ Specifically, heroin purity increased by 60% ($p = 0.568$),
42
43 cocaine purity increased by 11% ($p = 0.181$), and cannabis **herb** potency
44
45 increased by 161% ($p < 0.001$) during this time. During the same period, the
46
47 prices of heroin, cocaine, and cannabis decreased 81% ($p < 0.001$), 80% ($p <$
48
49 0.001), and 86% ($p < 0.001$) respectively.
50
51
52
53

54
55 Figure 2 presents data collected by the UNODC on the street price of
56
57 cocaine and opiates in participating European countries (i.e., Austria, Belgium,

Werb et al. Effectiveness of enforcement-based supply reduction...

Denmark, Finland, France, Germany, Greece, Italy, Luxembourg, Netherlands, Norway, Iceland, Portugal, Spain, Sweden, Switzerland, United Kingdom, and Ireland).²⁶ In these countries, between 1990 and 2009, the aggregate average retail street price of cocaine decreased by 51%, from \$198 USD per gram to \$98 USD per gram ($p < 0.001$). Similarly, the aggregate average price of opiates in Europe decreased 74%, from a high of \$295 USD per gram in 1990 to \$77 USD per gram in 2009 ($p < 0.001$).

Data from the Australian Illicit Drug Reporting System (IDRS) were available from 2000 to 2010. IDRS data suggest that the price of illegal drugs in Australia fluctuated substantially during this period. Specifically, after adjustment, the price of heroin decreased by 49%, from approximately \$460 USD per gram to approximately \$235 per gram ($p < 0.001$), **despite the well-described heroin 'drought' of 2001,²⁷ which saw a reduction in the supply and availability of heroin in Australia. Additionally,** the price of cocaine decreased 14% from approximately \$255 AUD per gram to \$220 AUD per gram ($p = 0.477$), and the price of cannabis decreased 49% from approximately \$25 AUD per gram to \$13 AUD per gram ($p < 0.001$).²⁸

Seizures

Domestic Markets

Figure 3 presents data on cannabis and cocaine seizures in the US between 1990 and 2010. As shown, data from the US Drug Enforcement Administration's STRIDE surveillance system demonstrate that the amount of cannabis herb seized by the Drug Enforcement Administration both in, and destined for, the US rose 465%, from approximately 130,000 kilograms in 1990

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 to approximately 720,000 kilograms in 2010 ($p < 0.001$). During this same period,
3
4 despite fluctuations, the amount of cocaine seized by the US Drug Enforcement
5 Administration decreased 49%, from approximately 57,000 kilograms in 1990 to
6 29,000 in 2010 ($p = 0.409$), while the amount of heroin seized increased 29%
7 from approximately 535 kilograms in 1990 to 690 kilograms ($p = 0.979$, heroin
8 seizure data not shown).²⁹

9
10
11
12
13
14
15
16
17 Figure 4 presents data on cannabis, cocaine and heroin seizures in
18 countries participating in the European Monitoring Centre for Drugs and Drug
19 Addiction's Reitox surveillance network (i.e., European Union member countries,
20 as well as Croatia, Norway, and Turkey), between 1995 and 2009. As can be
21 seen, annual estimates of the quantity of both cocaine and cannabis **herb** seized
22 fluctuated throughout this period; however, the quantity of heroin seized
23 increased relatively steadily. Specifically, the number of kilograms of cannabis
24 herb seized was at a low of approximately 57,000 kilograms in 1995, and peaked
25 one year later in 1996 at approximately 138,000 kilograms ($p = 0.446$). The
26 number of cocaine seizures was at a low of approximately 21,000 kilograms in
27 1995, and peaked at approximately 121,000 kilograms in 2006 ($p = 0.018$).
28 Finally, the number of kilograms of heroin seized increased 380% from a low of
29 approximately 5,000 in 1995 to a high of approximately 24,000 in 2009 ($p <$
30 0.001).

has declined throughout the last decade, with opium production decreasing by approximately 60% and 90% in Myanmar and Lao, respectively.³⁰ In this region, trends in seizures of opium have fluctuated; 3,198 kilograms of opium were seized in 1990, with a high of 12,462 kilograms seized in 2007 before a steep decline to 1,225 kilograms in 2010 ($p = 0.856$). Similarly, seizures of heroin fluctuated, with a decrease of more than half, from 1,337 kilograms in 1990, to 627 kilograms in 2010 ($p = 0.085$), and a peak of 1,565 kilograms seized in 2009. In Afghanistan, which is believed to supply over 90% of the world's opium,³⁰ seizures of raw and prepared opium increased by over 12,000%, from 453 kilograms in 1990 to 57,023 kilograms in 2010, and seizures of heroin increased by over 600%, from 1,256 kilograms in 1990 to 9,036 kilograms in 2010 (Note: missing data prevented a trend test for annual opium and heroin seizures in Afghanistan).

With respect to cocaine seizures, according to the UNODC, Latin America's Andean region, which includes Peru, Bolivia, and Colombia, is the primary global supplier of this drug, as coca leaf is grown exclusively in this region.³¹ While seizures of cocaine in the Andean region decreased 81%, from 97,437 kilograms in 1990 to 17,835 kilograms in 2007 ($p = 0.028$), seizures of coca leaf increased 188% from 601,038 kilograms in 1990 to 1.73 million kilograms in 2007 ($p = 0.004$). During the same period, the area of coca cultivation in this region declined slightly, from approximately 210,000 hectares to 180,000 hectares ($p = 0.004$).

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2
3 Finally, according to the UNODC, major areas of cannabis cultivation exist
4 in North Africa, Afghanistan, and North America. These areas are net exporters
5 of cannabis, though most cannabis-producing countries also produce the drug for
6 internal consumption.²⁰ In North Africa (i.e., Algeria, Morocco, and Tunisia),
7 seizures of cannabis herb increased by 208% from 67,930 kilograms in 1990 to
8 209,445 kilograms in 2007 ($p = 0.015$). In North America (i.e., Canada, the
9 United States, and Mexico), seizures of cannabis herb increased by 288% from
10 782,607 kilograms in 1990 to 3.05 million kilograms in 2007 ($p < 0.001$). In
11 Afghanistan, while data on cannabis herb seizures are not available, seizures of
12 cannabis resin increased 630% from 5,068 kilograms in 1990 to 36,972
13 kilograms in 2006 ($p = 0.061$).

28 CONCLUSIONS

29
30
31 Longitudinal data from government surveillance systems demonstrate that
32 over the past two decades there has been a general pattern of increased illegal
33 drug supply as defined through lower price and higher purity of heroin, cocaine
34 and cannabis. During the same period, patterns of drug seizures either increased
35 or remained stable, though the trends detected in some of these indicators did
36 not reach statistical significance. **As such, we conclude, consistent with
37 previous studies,¹⁹ that the global supply of illicit drugs has likely not been
38 reduced in the previous two decades. In particular, the data presented in
39 this study suggest that the supply of opiates and cannabis, in particular,
40 have increased, given the increasing potency and decreasing prices of
41 these illegal commodities. These results have implications for the
42 development of evidence-based drug policies, particularly given the

Werb et al. Effectiveness of enforcement-based supply reduction...

interest in novel drug policy approaches in a number of settings in Latin America, North America, and Europe.³²⁻³⁴

As noted elsewhere,^{35, 36} there are limitations of ecologic analyses based on international surveillance systems. First, some states collect little or no data on indicators of illegal drug supply, whereas other states spend significant energy on monitoring drug availability. Second, even in states that closely track indicators of supply, the degree to which seized samples of illegal drugs reflect purity of retail drugs sold on the street is subject to variation, though where possible we presented purity-adjusted prices to address this limitation.²³ Nevertheless, the long-term trends in increasing purity and decreasing price presented here likely reflect overall trends in many regions, **though it should be noted that in some regions (e.g., Europe), indicators of price and purity may have been strongly influenced by a few countries such as the United Kingdom and Spain. Additionally, some exceptions in the trends were observed.** Australia for instance, while experiencing a significant decrease in the prices of both heroin and cannabis, did not experience a significant decrease in the price of cocaine, which may reflect the geographic isolation of the region or other market factors. **It is also of note that Australia's 'heroin drought',³⁷ which saw a sudden drop in measures of the supply and availability of heroin, appears to have had a limited long-term impact on supply, though some experts suggest that it may have resulted in higher levels of polysubstance use among Australian heroin injectors.²⁷** Third, limitations in longitudinal data collection precluded our ability to include amphetamine-type stimulants and other emerging synthetic substances, as this data is

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 **limited to certain countries and the focus of this study was on regional**
4
5 **trends. It is noteworthy in this regard that the production of synthetic**
6
7 **substances – as well as indoor cannabis cultivation – present particular**
8
9 **challenges for supply reduction strategies,** given that these drugs can be
10
11 mass produced in clandestine locations regardless of climate or other factors that
12
13 limit traditional drug production.^{20, 38} Finally, while this review focused on
14
15 **patterns of price and purity of selected illegal drugs,** these measures are only a
16
17 marker of drug supply, and do not measure other factors determining availability
18
19 and concomitant rates of drug use. **These limitations to assessing global drug**
20
21 **supply using classic proxy measures such as price, purity, and, to a lesser**
22
23 **extent, seizures, suggests that there may be a need to expand the range of**
24
25 **measures systematically collected by governments and international**
26
27 **bodies such as the UNODC and the European Monitoring Centre for Drugs**
28
29 **and Drug Addiction. In particular, meaningfully incorporating measures**
30
31 **derived from street-level questionnaires of people who use drugs may**
32
33 **provide a more reliable metric of supply and availability. Indeed, some**
34
35 **bodies, such as Australia’s IDRS, collect such data,²⁸ and this**
36
37 **methodological approach should be considered by those coordinating**
38
39 **surveillance of illegal drugs. Other bodies have also prioritized**
40
41 **emphasizing measures of community health including reduced HIV**
42
43 **infections, reduced drug-related violence and reductions in numbers of**
44
45 **individuals incarcerated.^{39, 40}**

54
55 In summary, longitudinal illegal drug surveillance systems demonstrate a
56
57 general global pattern of falling drug prices and increasing drug purity and
58
59
60

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 potency, alongside a relatively consistent pattern of increasing seizures of illegal
3 drugs. **Although source data have limitations and there are some**
4 **exceptions to these trends, these findings should be useful given the**
5 **current debates and drug policy experimentation under way in Latin**
6 **America, North America, and Europe.³²⁻³⁴ It is hoped that this study**
7 **highlights the need to re-examine the effectiveness of national and**
8 **international drug strategies that place a disproportionate emphasis on**
9 **supply reduction at the expense of evidence-based prevention and**
10 **treatment of problematic illegal drug use.**

Table 1: Major Illegal Drug Data Surveillance Systems

| Surveillance system | Country/Region | Inception Date | Illegal drugs considered | | | Outcomes considered | | | | Summary of findings |
|---|----------------|----------------|--------------------------|---------|--------|---------------------|--------|-----|----------|--|
| | | | cannabis | cocaine | heroin | Price | Purity | Use | Seizures | |
| University of Mississippi Marijuana Project | USA | 1975 - | X | | | | X | | | Cannabis potency increased between 1990 and 2009. |
| STRIDE Surveillance System | USA | 1986- | X | X | X | X | X | | | Price decreased and purity/potency increased across all illegal drugs considered. |
| UNODC Drug Seizures Database | International | 1980 - | X | X | X | | | | X | Seizures of all drugs have increased between 1995 and 2006. |
| UNODC Annual Reports Questionnaire | International | 1990 - | X | X | X | X | X | X | | Prices of opiates, cocaine, and cannabis have generally decreased in Europe and the US while purity and potency have increased. |
| Reitox (EMCDDA database) | Europe | 1993 - | X | X | X | X | | | X | Price of all illegal substances decreased in 2002 to 2007. Cocaine, cannabis, and heroin seizures increased between 2002 and 2007. |
| Illicit Drug Reporting System | Australia | 2000 - | X | X | X | X | X | | X | Between 2000 and 2010, the price of cocaine, cannabis and heroin decreased, while perceived purity remained stable. |
| National Drug Threat Assessment | USA | 2001 - | X | X | X | X | | | X | Between 2005 and 2009, cocaine purity decreased whereas price increased. |

Note: STRIDE: System To Retrieve Information from Drug Evidence, EU = European Union, EC = European Commission; EMCDDA = European Monitoring Centre For Drugs and Drug Addiction; UNODC = United Nations Office of Drug Control

ABSTRACT

Objectives: Illegal drug use continues to be a major threat to community health and safety. We used international drug surveillance databases to assess the relationship between multiple long-term estimates of illegal drug price and purity.

Design: We systematically searched for longitudinal measures of illegal drug supply indicators to assess the long-term impact of enforcement-based supply reduction interventions.

Setting: Data from identified illegal drug surveillance systems were analysed using an *a priori* defined protocol in which we sought to present annual estimates beginning in 1990. Data were then subjected to trend analyses.

Main Outcome Measures: Data were obtained from government surveillance systems assessing price, purity, and/or seizure quantities of illegal drugs; systems with at least 10 years of longitudinal data assessing price, purity/potency, or seizures were included.

Results: We identified 7 regional/international meta-surveillance systems with longitudinal measures of price or purity/potency that met eligibility criteria. In the United States, the average inflation- and purity-adjusted prices of heroin, cocaine, and cannabis decreased by 81%, 80% and 86% respectively between 1990 and 2007, whereas average purity increased by 60%, 11%, and 161% respectively. Similar trends were observed in Europe, where during the same period the average inflation-adjusted price of opiates and cocaine decreased by 74% and 51% respectively. In Australia, the average inflation-adjusted price of cocaine decreased 14%, while the inflation-adjusted price of heroin and cannabis both decreased 49% between 2000 and 2010. During this time, seizures of these drugs in major production regions and major domestic markets generally increased.

Conclusions: With few exceptions and despite increasing investments in enforcement-based supply reduction efforts aimed at disrupting global drug supply, illegal drug prices have generally decreased while drug purity has generally increased since 1990. These findings suggest that expanding efforts at controlling the global illegal drug market through law enforcement are failing.

Werb et al. Effectiveness of enforcement-based supply reduction...

Article Summary

Article focus

- Studies have demonstrated that illegal drug use remains a threat to community health and safety.
- However, less is known regarding the long-term impact of efforts to reduce the overall supply of illegal drugs.

Key messages

- Using longitudinal governmental surveillance data, this study demonstrates that over the past two decades, the supply of major illegal drugs has increased, as measured through a general decline in the price, and a general increase in the purity of illegal drugs in a variety of settings.

Strengths and limitations

- This study was limited by the quality and consistency of surveillance data on illegal drug supply
- This study presents data on trends in illegal drug supply in a variety of settings over two decades, including consumer and export drug markets

Werb et al. Effectiveness of enforcement-based supply reduction...

OBJECTIVES

The United Nations (UN) recently estimated that the global illegal drug trade is worth at least \$350 billion USD annually,¹ and illegal drug use remains a major threat to community health and safety.^{2, 3} In addition to the range of harms associated with the direct health effects of drugs, including fatal overdose,^{4, 5} illegal drug use is also one of the key global drivers of blood borne disease transmission, in particular human immunodeficiency virus (HIV) infection.^{6, 7} Illegal drug markets also contribute to community concerns such as high rates of violence in settings where the trade proliferates.⁸

In response to the health and social concerns associated with illegal drug use, several UN conventions were created to control the possession, consumption, and manufacture of illegal drugs.⁹⁻¹¹ As a result, over the last several decades, most national drug control strategies have prioritized drug law enforcement interventions to reduce drug supply, despite recent calls by experts to explore alternative models of drug control such as systems of drug decriminalization and legal regulation.¹²⁻¹⁴ Some unintended consequences of this approach, such as record incarceration rates, have been well-documented.¹⁵⁻¹⁸ Additionally, a small number of studies assessing aspects of drug supply, measured through indicators of drug price, purity/potency and seizures, have been undertaken to describe the global relationship between these indicators over the long-term.¹⁹ However, systematic evaluation of these relationships is still needed to elucidate patterns of drug supply. The present study therefore sought to systematically identify international data from publicly available illegal drug surveillance systems to assess long-term estimates of illegal drug supply.

Werb et al. Effectiveness of enforcement-based supply reduction...

DESIGN

Outcomes of interest

The primary outcomes of interest were long-term patterns of illegal drug supply, measured through indicators of price and purity/potency for three major illegal drugs: cannabis, cocaine, and opiates (e.g., opium and heroin). While data on amphetamine-type stimulants exist in some specific countries (e.g., the United Kingdom), this class of drugs was not included given inconsistent data collection and classification, and fluctuating surveillance periods and overall data quality. A secondary outcome of interest was data on illegal drug seizures in a) major illegal drug source regions and, b) major destination markets, as identified by the United Nations Office on Drugs and Crime (UNODC).²⁰ These secondary outcome data were used as an additional proxy measure to assess the availability of illegal drugs in specific regions, as has been done previously.^{21, 22} All outcomes were systematically identified through publicly available illegal drug surveillance systems. Linear by linear association trend tests were carried out on **annual** estimates of all outcomes of interest. Price and purity estimates represent median values for each year, while estimates for seizures represent crude totals of quantity seized. All price estimates are expressed in 2011 USD and are, where possible, adjusted for purity.²³

Illegal drug surveillance systems

An online search of surveillance systems monitoring illegal drugs using two *a priori* defined inclusion criteria was carried out. Search terms included: drugs, illicit, illegal, price, purity, potency, surveillance system, government data, longitudinal, annual, estimate. Inclusion/exclusion criteria were as follows: only

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2 surveillance systems that included continuous longitudinal assessments of these
3
4 outcomes of interest for at least 10 years were included because we specifically
5
6 sought to assess the long-term impact of enforcement-based supply reduction
7
8 strategies on illegal drug price and purity/potency. Finally, data extraction was
9
10 restricted to 1990 and onwards to focus on patterns of supply during recent
11
12 decades.
13
14

15
16 Data were obtained through online searches of registries of surveillance
17
18 systems (e.g., governmental websites, United Nations databases), governmental
19
20 reports, and peer-reviewed publications, through referrals from experts in the
21
22 field, and through data requests to relevant organizations including the UNODC.
23
24 All authors had complete access to all data and all had final responsibility to
25
26 submit for publication. Ethics approval was not required given that we relied
27
28 exclusively on publicly available data.
29
30
31

32 33 RESULTS

34
35 We identified 7 government surveillance systems that met inclusion
36
37 criteria. Of these, 3 (43%) reported on international data, 3 (43%) reported on
38
39 data from the United States (US), and 1 (14%) reported on data from Australia.
40
41 One of the longest-running surveillance system identified, the US-based
42
43 Marijuana Potency Monitoring Project, is funded by the U.S. National Institutes of
44
45 Health and was established in 1975, while the most recent surveillance system
46
47 was established in 2001 (e.g., the US-based *National Drug Threat Assessment*).
48
49 With respect to international surveillance systems, the UNODC administers two
50
51 separate surveillance systems that collect data from all participating United
52
53 Nations member states: the Annual Reports Questionnaire surveillance system

that collects price and purity/potency data, and the Drug Seizures Database that collects seizure data. Finally, the European Monitoring Centre for Drugs and Drug Addiction administers the Reitox drug surveillance system network, which aggregates data from a number of country-level surveillance systems in Europe, as described below.²⁴

Price and Purity/Potency

Table 1 presents surveillance systems that matched search criteria. An assessment of data provided by these surveillance systems demonstrated a number of broad trends. First, purity and/or potency of illegal drugs generally remained stable or increased overall during the study period. Second, the price of illegal drugs, with few exceptions, generally decreased. Third, seizures of cannabis, cocaine and opiates generally increased in major drug production regions and major domestic markets.

Figure 1 presents data from the US Drug Enforcement Administration's System To Retrieve Information from Drug Evidence (STRIDE). As can be seen, between 1990 and 2007 (the last year for which data are publicly available), the purity of heroin and cocaine, and the potency of cannabis herb in the US increased, while the inflation- and purity-adjusted retail street prices of these three drugs declined.²⁵ Specifically, heroin purity increased by 60% ($p = 0.568$), cocaine purity increased by 11% ($p = 0.181$), and cannabis herb potency increased by 161% ($p < 0.001$) during this time. During the same period, the prices of heroin, cocaine, and cannabis decreased 81% ($p < 0.001$), 80% ($p < 0.001$), and 86% ($p < 0.001$) respectively.

Figure 2 presents data collected by the UNODC on the street price of cocaine and opiates in participating European countries (i.e., Austria, Belgium, Denmark, Finland, France, Germany, Greece, Italy, Luxembourg, Netherlands, Norway, Iceland, Portugal, Spain, Sweden, Switzerland, United Kingdom, and Ireland).²⁶ In these countries, between 1990 and 2009, the aggregate average retail street price of cocaine decreased by 51%, from \$198 USD per gram to \$98 USD per gram ($p < 0.001$). Similarly, the aggregate average price of opiates in Europe decreased 74%, from a high of \$295 USD per gram in 1990 to \$77 USD per gram in 2009 ($p < 0.001$).

Data from the Australian Illicit Drug Reporting System (IDRS) were available from 2000 to 2010. IDRS data suggest that the price of illegal drugs in Australia fluctuated substantially during this period. Specifically, after adjustment, the price of heroin decreased by 49%, from approximately \$460 USD per gram to approximately \$235 per gram ($p < 0.001$), despite the well-described heroin 'drought' of 2001,²⁷ which saw a reduction in the supply and availability of heroin in Australia. Additionally, the price of cocaine decreased 14% from approximately \$255 AUD per gram to \$220 AUD per gram ($p = 0.477$), and the price of cannabis decreased 49% from approximately \$25 AUD per gram to \$13 AUD per gram ($p < 0.001$).²⁸

Seizures

Domestic Markets

Figure 3 presents data on cannabis and cocaine seizures in the US between 1990 and 2010. As shown, data from the US Drug Enforcement Administration's STRIDE surveillance system demonstrate that the amount of

cannabis herb seized by the Drug Enforcement Administration both in, and destined for, the US rose 465%, from approximately 130,000 kilograms in 1990 to approximately 720,000 kilograms in 2010 ($p < 0.001$). During this same period, despite fluctuations, the amount of cocaine seized by the US Drug Enforcement Administration decreased 49%, from approximately 57,000 kilograms in 1990 to 29,000 in 2010 ($p = 0.409$), while the amount of heroin seized increased 29% from approximately 535 kilograms in 1990 to 690 kilograms ($p = 0.979$, heroin seizure data not shown).²⁹

Figure 4 presents data on cannabis, cocaine and heroin seizures in countries participating in the European Monitoring Centre for Drugs and Drug Addiction's Reitox surveillance network (i.e., European Union member countries, as well as Croatia, Norway, and Turkey), between 1995 and 2009. As can be seen, annual estimates of the quantity of both cocaine and cannabis herb seized fluctuated throughout this period; however, the quantity of heroin seized increased relatively steadily. Specifically, the number of kilograms of cannabis herb seized was at a low of approximately 57,000 kilograms in 1995, and peaked one year later in 1996 at approximately 138,000 kilograms ($p = 0.446$). The number of cocaine seizures was at a low of approximately 21,000 kilograms in 1995, and peaked at approximately 121,000 kilograms in 2006 ($p = 0.018$). Finally, the number of kilograms of heroin seized increased 380% from a low of approximately 5,000 in 1995 to a high of approximately 24,000 in 2009 ($p < 0.001$).

Production Regions

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 With respect to opiate seizures, the Golden Triangle includes parts of
4 Thailand, Lao, Viet Nam and Myanmar, and according to the UNODC, this region
5 is the second largest supplier of heroin globally, though production has declined
6 throughout the last decade, with opium production decreasing by approximately
7 60% and 90% in Myanmar and Lao, respectively.³⁰ In this region, trends in
8 seizures of opium have fluctuated; 3,198 kilograms of opium were seized in
9 1990, with a high of 12,462 kilograms seized in 2007 before a steep decline to
10 1,225 kilograms in 2010 ($p = 0.856$). Similarly, seizures of heroin fluctuated, with
11 a decrease of more than half, from 1,337 kilograms in 1990, to 627 kilograms in
12 2010 ($p = 0.085$), and a peak of 1,565 kilograms seized in 2009. In Afghanistan,
13 which is believed to supply over 90% of the world's opium,³⁰ seizures of raw and
14 prepared opium increased by over 12,000%, from 453 kilograms in 1990 to
15 57,023 kilograms in 2010, and seizures of heroin increased by over 600%, from
16 1,256 kilograms in 1990 to 9,036 kilograms in 2010 (Note: missing data
17 prevented a trend test for annual opium and heroin seizures in Afghanistan).

32
33
34
35
36

37
38 With respect to cocaine seizures, according to the UNODC, Latin
39 America's Andean region, which includes Peru, Bolivia, and Colombia, is the
40 primary global supplier of this drug, as coca leaf is grown exclusively in this
41 region.³¹ While seizures of cocaine in the Andean region decreased 81%, from
42 97,437 kilograms in 1990 to 17,835 kilograms in 2007 ($p = 0.028$), seizures of
43 coca leaf increased 188% from 601,038 kilograms in 1990 to 1.73 million
44 kilograms in 2007 ($p = 0.004$). During the same period, the area of coca
45 cultivation in this region declined slightly, from approximately 210,000 hectares to
46 180,000 hectares ($p = 0.004$).

Finally, according to the UNODC, major areas of cannabis cultivation exist in North Africa, Afghanistan, and North America. These areas are net exporters of cannabis, though most cannabis-producing countries also produce the drug for internal consumption.²⁰ In North Africa (i.e., Algeria, Morocco, and Tunisia), seizures of cannabis herb increased by 208% from 67,930 kilograms in 1990 to 209,445 kilograms in 2007 ($p = 0.015$). In North America (i.e., Canada, the United States, and Mexico), seizures of cannabis herb increased by 288% from 782,607 kilograms in 1990 to 3.05 million kilograms in 2007 ($p < 0.001$). In Afghanistan, while data on cannabis herb seizures are not available, seizures of cannabis resin increased 630% from 5,068 kilograms in 1990 to 36,972 kilograms in 2006 ($p = 0.061$).

CONCLUSIONS

Longitudinal data from government surveillance systems demonstrate that over the past two decades there has been a general pattern of increased illegal drug supply as defined through lower price and higher purity of heroin, cocaine and cannabis. During the same period, patterns of drug seizures either increased or remained stable, though the trends detected in some of these indicators did not reach statistical significance. As such, we conclude, consistent with previous studies,¹⁹ that the global supply of illicit drugs has likely not been reduced in the previous two decades. In particular, the data presented in this study suggest that the supply of opiates and cannabis, in particular, have increased, given the increasing potency and decreasing prices of these illegal commodities. These results have implications for the development of evidence-based drug policies,

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2 particularly given the interest in novel drug policy approaches in a number of
3
4 settings in Latin America, North America, and Europe.³²⁻³⁴
5
6

7 As noted elsewhere,^{35, 36} there are limitations of ecologic analyses based
8
9 on international surveillance systems. First, some states collect little or no data
10
11 on indicators of illegal drug supply, whereas other states spend significant energy
12
13 on monitoring drug availability. Second, even in states that closely track
14
15 indicators of supply, the degree to which seized samples of illegal drugs reflect
16
17 purity of retail drugs sold on the street is subject to variation, though where
18
19 possible we presented purity-adjusted prices to address this limitation.²³
20
21 Nevertheless, the long-term trends in increasing purity and decreasing price
22
23 presented here likely reflect overall trends in many regions, though it should be
24
25 noted that in some regions (e.g., Europe), indicators of price and purity may have
26
27 been strongly influenced by a few countries such as the United Kingdom and
28
29 Spain. Additionally, some exceptions in the trends were observed. Australia for
30
31 instance, while experiencing a significant decrease in the prices of both heroin
32
33 and cannabis, did not experience a significant decrease in the price of cocaine,
34
35 which may reflect the geographic isolation of the region or other market factors. It
36
37 is also of note that Australia's 'heroin drought',³⁷ which saw a sudden drop in
38
39 measures of the supply and availability of heroin, appears to have had a limited
40
41 long-term impact on supply, though some experts suggest that it may have
42
43 resulted in higher levels of polysubstance use among Australian heroin
44
45 injectors.²⁷ Third, limitations in longitudinal data collection precluded our ability to
46
47 include amphetamine-type stimulants and other emerging synthetic substances,
48
49 as this data is limited to certain countries and the focus of this study was on

regional trends. It is noteworthy in this regard that the production of synthetic substances – as well as indoor cannabis cultivation – present particular challenges for supply reduction strategies, given that these drugs can be mass produced in clandestine locations regardless of climate or other factors that limit traditional drug production.^{20, 38} Finally, while this review focused on patterns of price and purity of selected illegal drugs, these measures are only a marker of drug supply, and do not measure other factors determining availability and concomitant rates of drug use. These limitations to assessing global drug supply using classic proxy measures such as price, purity, and, to a lesser extent, seizures, suggests that there may be a need to expand the range of measures systematically collected by governments and international bodies such as the UNODC and the European Monitoring Centre for Drugs and Drug Addiction. In particular, meaningfully incorporating measures derived from street-level questionnaires of people who use drugs may provide a more reliable metric of supply and availability. Indeed, some bodies, such as Australia's IDRS, collect such data,²⁸ and this methodological approach should be considered by those coordinating surveillance of illegal drugs. Other bodies have also prioritized emphasizing measures of community health including reduced HIV infections, reduced drug-related violence and reductions in numbers of individuals incarcerated.^{39, 40}

In summary, longitudinal illegal drug surveillance systems demonstrate a general global pattern of falling drug prices and increasing drug purity and potency, alongside a relatively consistent pattern of increasing seizures of illegal drugs. Although source data have limitations and there are some exceptions to

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 these trends, these findings should be useful given the current debates and drug
3 policy experimentation under way in Latin America, North America, and
4 Europe.³²⁻³⁴ It is hoped that this study highlights the need to re-examine the
5 effectiveness of national and international drug strategies that place a
6 disproportionate emphasis on supply reduction at the expense of evidence-based
7 prevention and treatment of problematic illegal drug use.

Table 1: Major Illegal Drug Data Surveillance Systems

| Surveillance system | Country/Region | Inception Date | Illegal drugs considered | | | Outcomes considered | | | | Summary of findings |
|---|----------------|----------------|--------------------------|---------|--------|---------------------|--------|-----|----------|--|
| | | | cannabis | cocaine | heroin | Price | Purity | Use | Seizures | |
| University of Mississippi Marijuana Project | USA | 1975 - | X | | | | X | | | Cannabis potency increased between 1990 and 2009. |
| STRIDE Surveillance System | USA | 1986- | X | X | X | X | X | | | Price decreased and purity/potency increased across all illegal drugs considered. |
| UNODC Drug Seizures Database | International | 1980 - | X | X | X | | | | X | Seizures of all drugs have increased between 1995 and 2006. |
| UNODC Annual Reports Questionnaire | International | 1990 - | X | X | X | X | X | X | | Prices of opiates, cocaine, and cannabis have generally decreased in Europe and the US while purity and potency have increased. |
| Reitox (EMCDDA database) | Europe | 1993 - | X | X | X | X | | | X | Price of all illegal substances decreased in 2002 to 2007. Cocaine, cannabis, and heroin seizures increased between 2002 and 2007. |
| Illicit Drug Reporting System | Australia | 2000 - | X | X | X | X | X | | X | Between 2000 and 2010, the price of cocaine, cannabis and heroin decreased, while perceived purity remained stable. |
| National Drug Threat Assessment | USA | 2001 - | X | X | X | X | | | X | Between 2005 and 2009, cocaine purity decreased whereas price increased. |

ABSTRACT

Objectives: Illegal drug use continues to be a major threat to community health and safety. We used international drug surveillance databases to assess the relationship between multiple long-term estimates of illegal drug price and purity.

Design: We systematically searched for longitudinal measures of illegal drug supply indicators to assess the long-term impact of enforcement-based supply reduction interventions.

Setting: Data from identified illegal drug surveillance systems were analysed using an *a priori* defined protocol in which we sought to present annual estimates beginning in 1990. Data were then subjected to trend analyses.

Main Outcome Measures: Data were obtained from government surveillance systems assessing price, purity, and/or seizure quantities of illegal drugs; systems with at least 10 years of longitudinal data assessing price, purity/potency, or seizures were included.

Results: We identified 7 regional/international meta-surveillance systems with longitudinal measures of price or purity/potency that met eligibility criteria. In the United States, the average inflation- and purity-adjusted prices of heroin, cocaine, and cannabis decreased by 81%, 80% and 86% respectively between 1990 and 2007, whereas average purity increased by 60%, 11%, and 161% respectively. Similar trends were observed in Europe, where during the same period the average inflation-adjusted price of opiates and cocaine decreased by 74% and 51% respectively. In Australia, the average inflation-adjusted price of cocaine decreased 14%, while the inflation-adjusted price of heroin and cannabis both decreased 49% between 2000 and 2010. During this time, seizures of these drugs in major production regions and major domestic markets generally increased.

Conclusions: With few exceptions and despite increasing investments in enforcement-based supply reduction efforts aimed at disrupting global drug supply, illegal drug prices have generally decreased while drug purity has generally increased since 1990. These findings suggest that expanding efforts at controlling the global illegal drug market through law enforcement are failing.

Werb et al. Effectiveness of enforcement-based supply reduction...

Article Summary

Article focus

- Studies have demonstrated that illegal drug use remains a threat to community health and safety.
- However, less is known regarding the long-term impact of efforts to reduce the overall supply of illegal drugs.

Key messages

- Using longitudinal governmental surveillance data, this study demonstrates that over the past two decades, the supply of major illegal drugs has increased, as measured through a general decline in the price, and a general increase in the purity of illegal drugs in a variety of settings.

Strengths and limitations

- This study was limited by the quality and consistency of surveillance data on illegal drug supply
- This study presents data on trends in illegal drug supply in a variety of settings over two decades, including consumer and export drug markets

Werb et al. Effectiveness of enforcement-based supply reduction...

OBJECTIVES

The United Nations (UN) recently estimated that the global illegal drug trade is worth at least \$350 billion USD annually,¹ and illegal drug use remains a major threat to community health and safety.^{2,3} In addition to the range of harms associated with the direct health effects of drugs, including fatal overdose,^{4,5} illegal drug use is also one of the key global drivers of blood borne disease transmission, in particular human immunodeficiency virus (HIV) infection.^{6,7} Illegal drug markets also contribute to community concerns such as high rates of violence in settings where the trade proliferates.⁸

In response to the health and social concerns associated with illegal drug use, several UN conventions were created to control the possession, consumption, and manufacture of illegal drugs.⁹⁻¹¹ As a result, over the last several decades, most national drug control strategies have prioritized drug law enforcement interventions to reduce drug supply, despite recent calls by experts to explore alternative models of drug control such as systems of drug decriminalization and legal regulation.¹²⁻¹⁴ Some unintended consequences of this approach, such as record incarceration rates, have been well-documented.¹⁵⁻¹⁸ Additionally, a small number of studies assessing aspects of drug supply, measured through indicators of drug price, purity/potency and seizures, have been undertaken to describe the global relationship between these indicators over the long-term.¹⁹ However, systematic evaluation of these relationships is still needed to elucidate patterns of drug supply. The present study therefore sought

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 to systematically identify international data from publicly available illegal drug
3 surveillance systems to assess long-term estimates of illegal drug supply.
4
5
6

7 DESIGN

8 *Outcomes of interest*

9
10 The primary outcomes of interest were long-term patterns of illegal drug
11 supply, measured through indicators of price and purity/potency for three major
12 illegal drugs: cannabis, cocaine, and opiates (e.g., opium and heroin). While data
13 on amphetamine-type stimulants exist in some specific countries (e.g., the United
14 Kingdom), this class of drugs was not included given inconsistent data collection
15 and classification, and fluctuating surveillance periods and overall data quality.
16
17 A secondary outcome of interest was data on illegal drug seizures in a) major
18 illegal drug source regions and, b) major destination markets, as identified by the
19 United Nations Office on Drugs and Crime (UNODC).²⁰ These secondary
20 outcome data were used as an additional proxy measure to assess the availability
21 of illegal drugs in specific regions, as has been done previously.^{21, 22} All outcomes
22 were systematically identified through publicly available illegal drug
23 surveillance systems. Linear by linear association trend tests were carried out on
24 **annual** estimates of all outcomes of interest. **Price and purity estimates**
25 **represent median values for each year, while estimates for seizures represent**
26 **crude totals of quantity seized.** All price estimates are expressed in 2011 USD
27 and are, where possible, adjusted for purity.²³

55 *Illegal drug surveillance systems*

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 An online search of surveillance systems monitoring illegal drugs using
4
5 two *a priori* defined inclusion criteria was carried out. **Search terms included:**
6
7 **drugs, illicit, illegal, price, purity, potency, surveillance system, government**
8
9 **data, longitudinal, annual, estimate. Inclusion/exclusion criteria were as**
10
11 **follows: only surveillance systems that included continuous longitudinal**
12
13 **assessments of these outcomes of interest for at least 10 years were included**
14
15 **because we specifically sought to assess the long-term impact of enforcement-**
16
17 **based supply reduction strategies on illegal drug price and purity/potency.**
18
19 **Finally, data extraction was restricted to 1990 and onwards to focus on patterns**
20
21 **of supply during recent decades.**

22
23
24
25
26
27 Data were obtained through online searches of registries of surveillance
28
29 systems (e.g., governmental websites, United Nations databases),
30
31 governmental reports, and peer-reviewed publications, through referrals from
32
33 experts in the field, and through data requests to relevant organizations
34
35 including the UNODC. All authors had complete access to all data and all had
36
37 final responsibility to submit for publication. Ethics approval was not required
38
39 given that we relied exclusively on publicly available data.
40
41
42
43

44 RESULTS

45
46 We identified 7 government surveillance systems that met inclusion
47
48 criteria. Of these, 3 (43%) reported on international data, 3 (43%) reported on data
49
50 from the United States (US), and 1 (14%) reported on data from Australia. One of
51
52 the longest-running surveillance system identified, the US-based Marijuana
53
54 Potency Monitoring Project, is funded by the U.S. National Institutes of Health
55
56
57
58
59
60

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 and was established in 1975, while the most recent surveillance system was
4
5 established in 2001 (e.g., the US-based *National Drug Threat Assessment*). With
6
7 respect to international surveillance systems, the UNODC administers two
8
9 separate surveillance systems that collect data from all participating United
10
11 Nations member states: the Annual Reports Questionnaire surveillance system
12
13 that collects price and purity/potency data, and the Drug Seizures Database that
14
15 collects seizure data. Finally, the European Monitoring Centre for Drugs and
16
17 Drug Addiction administers the Reitox drug surveillance system network, which
18
19 aggregates data from a number of country-level surveillance systems in Europe,
20
21 as described below.²⁴

22 23 24 25 26 27 **Price and Purity/Potency**

28
29
30 Table 1 presents surveillance systems that matched search criteria. An
31
32 assessment of data provided by these surveillance systems demonstrated a
33
34 number of broad trends. First, purity and/or potency of illegal drugs generally
35
36 remained stable or increased overall during the study period. Second, the price
37
38 of illegal drugs, with few exceptions, generally decreased. Third, seizures of
39
40 cannabis, cocaine and opiates generally increased in major drug production
41
42 regions and major domestic markets.

43
44
45
46
47 Figure 1 presents data from the US Drug Enforcement Administration's
48
49 System To Retrieve Information from Drug Evidence (STRIDE). As can be seen,
50
51 between 1990 and 2007 (the last year for which data are publicly available), the
52
53 purity of heroin and cocaine, and the potency of cannabis herb in the US
54
55 increased, while the inflation- and purity-adjusted retail street prices of these
56
57
58
59
60

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 three drugs declined.²⁵ Specifically, heroin purity increased by 60% ($p = 0.568$),
3
4 cocaine purity increased by 11% ($p = 0.181$), and cannabis herb potency increased
5
6 by 161% ($p < 0.001$) during this time. During the same period, the prices of
7
8 heroin, cocaine, and cannabis decreased 81% ($p < 0.001$), 80% ($p < 0.001$), and 86%
9
10 ($p < 0.001$) respectively.
11
12

13
14
15 Figure 2 presents data collected by the UNODC on the street price of
16 cocaine and opiates in participating European countries (i.e., Austria, Belgium,
17 Denmark, Finland, France, Germany, Greece, Italy, Luxembourg, Netherlands,
18 Norway, Iceland, Portugal, Spain, Sweden, Switzerland, United Kingdom, and
19 Ireland).²⁶ In these countries, between 1990 and 2009, the aggregate average retail
20 street price of cocaine decreased by 51%, from \$198 USD per gram to \$98 USD
21 per gram ($p < 0.001$). Similarly, the aggregate average price of opiates in Europe
22 decreased 74%, from a high of \$295 USD per gram in 1990 to \$77 USD per gram
23 in 2009 ($p < 0.001$).

33
34
35
36

37 Data from the Australian Illicit Drug Reporting System (IDRS) were
38 available from 2000 to 2010. IDRS data suggest that the price of illegal drugs in
39 Australia fluctuated substantially during this period. Specifically, after
40 adjustment, the price of heroin decreased by 49%, from approximately \$460 USD
41 per gram to approximately \$235 per gram ($p < 0.001$), despite the well-described
42 heroin 'drought' of 2001,²⁷ which saw a reduction in the supply and availability
43 of heroin in Australia. Additionally, the price of cocaine decreased 14% from
44 approximately \$255 AUD per gram to \$220 AUD per gram ($p = 0.477$), and the

2 price of cannabis decreased 49% from approximately \$25 AUD per gram to \$13
3
4 AUD per gram ($p < 0.001$).²⁸

7 *Seizures*

9 *Domestic Markets*

10
11
12 Figure 3 presents data on cannabis and cocaine seizures in the US between
13 1990 and 2010. As shown, data from the US Drug Enforcement Administration's
14 STRIDE surveillance system demonstrate that the amount of cannabis herb
15 seized by the Drug Enforcement Administration both in, and destined for, the US
16 rose 465%, from approximately 130,000 kilograms in 1990 to approximately
17 720,000 kilograms in 2010 ($p < 0.001$). During this same period, despite
18 fluctuations, the amount of cocaine seized by the US Drug Enforcement
19 Administration decreased 49%, from approximately 57,000 kilograms in 1990 to
20 29,000 in 2010 ($p = 0.409$), while the amount of heroin seized increased 29% from
21 approximately 535 kilograms in 1990 to 690 kilograms ($p = 0.979$, heroin seizure
22 data not shown).²⁹

40
41
42 Figure 4 presents data on cannabis, cocaine and heroin seizures in
43 countries participating in the European Monitoring Centre for Drugs and Drug
44 Addiction's Reitox surveillance network (i.e., European Union member
45 countries, as well as Croatia, Norway, and Turkey), between 1995 and 2009. As
46 can be seen, annual estimates of the quantity of both cocaine and cannabis herb
47 seized fluctuated throughout this period; however, the quantity of heroin seized
48 increased relatively steadily. Specifically, the number of kilograms of cannabis
49 herb seized was at a low of approximately 57,000 kilograms in 1995, and peaked
50
51
52
53
54
55
56
57
58
59
60

1 *Werb et al. Effectiveness of enforcement-based supply reduction...*

2 one year later in 1996 at approximately 138,000 kilograms ($p = 0.446$). The
3
4 number of cocaine seizures was at a low of approximately 21,000 kilograms in
5
6
7
8 1995, and peaked at approximately 121,000 kilograms in 2006 ($p = 0.018$). Finally,
9
10 the number of kilograms of heroin seized increased 380% from a low of
11
12 approximately 5,000 in 1995 to a high of approximately 24,000 in 2009 ($p < 0.001$).
13

14 *Production Regions*

15
16
17 With respect to opiate seizures, the Golden Triangle includes parts of
18
19 Thailand, Lao, Viet Nam and Myanmar, and according to the UNODC, this
20
21 region is the second largest supplier of heroin globally, though production has
22
23 declined throughout the last decade, with opium production decreasing by
24
25 approximately 60% and 90% in Myanmar and Lao, respectively.³⁰ In this region,
26
27 trends in seizures of opium have fluctuated; 3,198 kilograms of opium were
28
29 seized in 1990, with a high of 12,462 kilograms seized in 2007 before a steep
30
31 decline to 1,225 kilograms in 2010 ($p = 0.856$). Similarly, seizures of heroin
32
33 fluctuated, with a decrease of more than half, from 1,337 kilograms in 1990, to
34
35 627 kilograms in 2010 ($p = 0.085$), and a peak of 1,565 kilograms seized in 2009. In
36
37 Afghanistan, which is believed to supply over 90% of the world's opium,³⁰
38
39 seizures of raw and prepared opium increased by over 12,000%, from 453
40
41 kilograms in 1990 to 57,023 kilograms in 2010, and seizures of heroin increased
42
43 by over 600%, from 1,256 kilograms in 1990 to 9,036 kilograms in 2010 (Note:
44
45 missing data prevented a trend test for annual opium and heroin seizures in

Werb et al. Effectiveness of enforcement-based supply reduction...

With respect to cocaine seizures, according to the UNODC, Latin America's Andean region, which includes Peru, Bolivia, and Colombia, is the primary global supplier of this drug, as coca leaf is grown exclusively in this region.³¹ While seizures of cocaine in the Andean region decreased 81%, from 97,437 kilograms in 1990 to 17,835 kilograms in 2007 ($p = 0.028$), seizures of coca leaf increased 188% from 601,038 kilograms in 1990 to 1.73 million kilograms in 2007 ($p = 0.004$). During the same period, the area of coca cultivation in this region declined slightly, from approximately 210,000 hectares to 180,000 hectares ($p = 0.004$).

Finally, according to the UNODC, major areas of cannabis cultivation exist in North Africa, Afghanistan, and North America. These areas are net exporters of cannabis, though most cannabis-producing countries also produce the drug for internal consumption.²⁰ In North Africa (i.e., Algeria, Morocco, and Tunisia), seizures of cannabis herb increased by 208% from 67,930 kilograms in 1990 to 209,445 kilograms in 2007 ($p = 0.015$). In North America (i.e., Canada, the United States, and Mexico), seizures of cannabis herb increased by 288% from 782,607 kilograms in 1990 to 3.05 million kilograms in 2007 ($p < 0.001$). In Afghanistan, while data on cannabis herb seizures are not available, seizures of cannabis resin increased 630% from 5,068 kilograms in 1990 to 36,972 kilograms in 2006 ($p = 0.061$).

CONCLUSIONS

Longitudinal data from government surveillance systems demonstrate that over the past two decades there has been a general pattern of increased

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 illegal drug supply as defined through lower price and higher purity of heroin,
4
5 cocaine and cannabis. During the same period, patterns of drug seizures either
6
7 increased or remained stable, though the trends detected in some of these
8
9 indicators did not reach statistical significance. As such, we conclude, consistent
10
11 with previous studies,¹⁹ that the global supply of illicit drugs has likely not been
12
13 reduced in the previous two decades. In particular, the data presented in this
14
15 study suggest that the supply of opiates and cannabis, in particular, have
16
17 increased, given the increasing potency and decreasing prices of these illegal
18
19 commodities. These results have implications for the development of evidence-
20
21 based drug policies, particularly given the interest in novel drug policy
22
23 approaches in a number of settings in Latin America, North America, and
24
25 Europe.³²⁻³⁴

26
27
28
29
30
31
32 As noted elsewhere,^{35, 36} there are limitations of ecologic analyses based on
33
34 international surveillance systems. First, some states collect little or no data on
35
36 indicators of illegal drug supply, whereas other states spend significant energy
37
38 on monitoring drug availability. Second, even in states that closely track
39
40 indicators of supply, the degree to which seized samples of illegal drugs reflect
41
42 purity of retail drugs sold on the street is subject to variation, though where
43
44 possible we presented purity-adjusted prices to address this limitation.²³
45
46
47
48
49 Nevertheless, the long-term trends in increasing purity and decreasing price
50
51 presented here likely reflect overall trends in many regions, though it should be
52
53 noted that in some regions (e.g., Europe), indicators of price and purity may have
54
55 been strongly influenced by a few countries such as the United Kingdom and
56
57
58
59
60

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 Spain. Additionally, some exceptions in the trends were observed. Australia for
4
5 instance, while experiencing a significant decrease in the prices of both heroin
6
7 and cannabis, did not experience a significant decrease in the price of cocaine,
8
9 which may reflect the geographic isolation of the region or other market factors.
10
11 It is also of note that Australia's 'heroin drought',³⁷ which saw a sudden drop in
12
13 measures of the supply and availability of heroin, appears to have had a limited
14
15 long-term impact on supply, though some experts suggest that it may have
16
17 resulted in higher levels of polysubstance use among Australian heroin
18
19 injectors.²⁷ Third, limitations in longitudinal data collection precluded our ability
20
21 to include amphetamine-type stimulants and other emerging synthetic
22
23 substances, as this data is limited to certain countries and the focus of this study
24
25 was on regional trends. It is noteworthy in this regard that the production of
26
27 synthetic substances – as well as indoor cannabis cultivation – present particular
28
29 challenges for supply reduction strategies, given that these drugs can be mass
30
31 produced in clandestine locations regardless of climate or other factors that limit
32
33 traditional drug production.^{20, 38} Finally, while this review focused on patterns of
34
35 price and purity of selected illegal drugs, these measures are only a marker of
36
37 drug supply, and do not measure other factors determining availability and
38
39 concomitant rates of drug use. These limitations to assessing global drug supply
40
41 using classic proxy measures such as price, purity, and, to a lesser extent,
42
43 seizures, suggests that there may be a need to expand the range of measures
44
45 systematically collected by governments and international bodies such as the
46
47 UNODC and the European Monitoring Centre for Drugs and Drug Addiction. In

57
58
59
60

Werb et al. Effectiveness of enforcement-based supply reduction...

1
2
3 particular, meaningfully incorporating measures derived from street-level
4
5 questionnaires of people who use drugs may provide a more reliable metric of
6
7 supply and availability. Indeed, some bodies, such as Australia's IDRS, collect
8
9 such data,²⁸ and this methodological approach should be considered by those
10
11 coordinating surveillance of illegal drugs. Other bodies have also prioritized
12
13 emphasizing measures of community health including reduced HIV infections,
14
15 reduced drug-related violence and reductions in numbers of individuals
16
17 incarcerated.^{39, 40}
18
19
20
21

22
23 In summary, longitudinal illegal drug surveillance systems demonstrate a
24
25 general global pattern of falling drug prices and increasing drug purity and
26
27 potency, alongside a relatively consistent pattern of increasing seizures of illegal
28
29 drugs. Although source data have limitations and there are some exceptions to
30
31 these trends, these findings should be useful given the current debates and drug
32
33 policy experimentation under way in Latin America, North America, and
34
35 Europe.³²⁻³⁴ It is hoped that this study highlights the need to re-examine the
36
37 effectiveness of national and international drug strategies that place a
38
39 disproportionate emphasis on supply reduction at the expense of evidence-based
40
41 prevention and treatment of problematic illegal drug use.

Werb et al. Effectiveness of enforcement-based supply reduction...

Table 1: Major Illegal Drug Data Surveillance Systems

| Surveillance system | Country/Region | Inception Date | Illegal drugs considered | | | Outcomes considered | | | | Summary of findings |
|---|----------------|----------------|--------------------------|---------|--------|---------------------|--------|-----|----------|--|
| | | | cannabis | cocaine | heroin | Price | Purity | Use | Seizures | |
| University of Mississippi Marijuana Project | USA | 1975 - | X | | | | X | | | Cannabis potency increased between 1990 and 2009. |
| STRIDE Surveillance System | USA | 1986- | X | X | X | X | X | | | Price decreased and purity/potency increased across all illegal drugs considered. |
| UNODC Drug Seizures Database | International | 1980 - | X | X | X | | | | X | Seizures of all drugs have increased between 1995 and 2006. |
| UNODC Annual Reports Questionnaire | International | 1990 - | X | X | X | X | X | X | | Prices of opiates, cocaine, and cannabis have generally decreased in Europe and the US while purity and potency have increased. |
| Reitox (EMCDDA database) | Europe | 1993 - | X | X | X | X | | | X | Price of all illegal substances decreased in 2002 to 2007. Cocaine, cannabis, and heroin seizures increased between 2002 and 2007. |
| Illicit Drug Reporting System | Australia | 2000 - | X | X | X | X | X | | X | Between 2000 and 2010, the price of cocaine, cannabis and heroin decreased, while perceived purity remained stable. |
| National Drug Threat Assessment | USA | 2001 - | X | X | X | X | | | X | Between 2005 and 2009, cocaine purity decreased whereas price increased. |

Note: STRIDE: System To Retrieve Information from Drug Evidence, EU = European Union, EC = European Commission; EMCDDA = European Monitoring Centre For Drugs and Drug Addiction; UNODC = United Nations Office of Drug Control
