1 **Supporting Materials and Methods**

2 *Culture of DLBCL and B-lymphoblastoid cell lines*

3 The cells (HT, SU-DHL-5 and EBV-transformed B-lymphoblastoid cell line
4 [LCL]) were cultured at 37°C and 7% CO₂ in RPMI 1640 medium (Gibco/BRL,
5 Grand Island, NY, USA) supplemented with 10% heat-inactivated FCS, 4 mM of
6 glutamine, 75 units/ml of streptomycin, and 100 units/ml of penicillin. Before the
7 analysis, the DLBCL and LCL lines were washed three times with PBS to minimize
8 contamination from serum. Cell viability was determined using the trypan blue
9 exclusion test. Samples from whole cell lysate were normalized based on protein
10 concentration and labeled for comparative proteomics analysis.

11 *Proteomic analysis*

12 *Protein separation and in-gel digestion*

13 Each 5 × 10⁵ cells were lysed by boiling and each 30 µg of extracted protein was
14 applied to 10% polyacrylamide gel electrophoresis. The gel was subsequently
15 visualized through Coomassie blue-staining. Gel lanes were divided into 18 sections
16 and all slices were cut into small gel pieces (< 1 mm³), followed by in-gel digestion.
17 All in-gel digestions of proteins were done manually in a laminar flow hood to reduce
18 the amount of keratin contamination. The gel pieces were destained with 50%
19 acetonitrile (ACN) and 25 mM of ammonium bicarbonate. Then, the gel pieces were
20 placed in 10 mM of dithiothreitol for 45 min at 56°C to reduce disulfide bonds. An
21 alkylation reaction was performed using freshly prepared iodoacetamide (55 mM) for
22 45 min at room temperature in the dark. Sequencing grade trypsin (final concentration:
23 4 ng/µl) was used to digest protein at 37°C for 16-18 h. Tryptic peptides were
24 extracted using a 60% ACN/1% trifluoroacetic acid solution. After the peptides had
25 been dried to remove the solvent, the re-dissolved tryptic peptides were subjected to

1 LC LTQ-FT ICR MS analysis.

2 *LC LTQ-FT ICR MS analysis*

3 MS/MS experiments were performed with an LTQ-FT ICR MS (Thermo
4 Electron, San Jose, CA, USA) equipped with a nano-electrospray ion source (New
5 Objective, Woburn, MA, USA), a binary HPLC pump (1100 Series; Agilent
6 Technologies, Santa Clara, CA, USA) and an autosampler (Famos 900 / 920 LC
7 Packings, Sunnyvale, CA, USA). Tryptic peptide mixtures were injected at a 10
8 μ L/min flow rate into a self-packed pre-column in line with a reverse phase C₁₈
9 nano-column (75 μ m I.D. \times 200 mm) that used resin (particle size, 5 μ m; pore size,
10 200 \AA) (Magic C₁₈AQ; Michrom Bioresources, Auburn, CA, USA). The analytic
11 program was set at a linear gradient from 5% to 50% ACN with a 60-min running
12 cycle and a split flow rate of 300 nl/min. The full-scan survey MS experiment (*m/z*
13 320-2,000) was executed in FT ICR MS with a mass resolution of 100,000 at *m/z* 400.
14 The top ten most abundant multiply charged ions were sequentially isolated for
15 MS/MS by LTQ. Singly charged ions were rejected for MS/MS sequencing.

16 *Mascot search and label-free quantitative analysis*

17 The *.raw files of spectra were converted to *.mgf files (Mascot Daemon 2.2;
18 Matrix Science Ltd., London, UK) and merged into a single file for searching using
19 Mascot Daemon software based on the IPI human database (v 3.66). The following
20 Mascot Daemon parameter settings were used: the peptide tolerance was 15 ppm with
21 2⁺ and 3⁺ peptide charges and the MS/MS tolerance was 0.6 Da. Two missed
22 cleavages by trypsin were allowed; carbamidomethyl (C) was used as a fixed
23 modification; and oxidation (M) and deamidated (NQ) were used as variable
24 modifications. The significance threshold for the identification was set as *p* < 0.01,
25 and at least two peptides were matched. Label-free quantitative analysis was done

1 using quantitative proteomics software (MaxQuant; Max Planck Institute of
2 Biochemistry, Munich, Germany. Available at: <http://www.maxquant.org/>) [22].

3 ***Enzyme-linked immunosorbent assay (ELISA) for RanGAP1***

4 Polystyrene 96 well ELISA plates (eBioscience, San Diego, CA, USA) were
5 incubated overnight at 4°C with 100 µl of coating buffer (0.1 M NaHCO₃ [pH = 9.6])
6 containing 0.2 µg/ml of purified capture monoclonal antibody (mAb, RanGAP1, C-5;
7 Santa Cruz). The wells were blocked with 100 µl of PBS with 10% FBS for 1 h at
8 room temperature (RT), and triplicates of 100 µl of serially diluted standard
9 (RanGAP1 full-length recombinant protein, Novus Biologicals, Littleton, CO, USA)
10 or test samples at various dilutions were added and incubated for 2 h at 37°C. Control
11 and samples as well as subsequent detection reagents were diluted in PBS with 0.05%
12 Tween 20. The fluid from the wells was aspirated and the plates were washed and
13 then incubated for 1 h at RT with 100 µl of detection polyclonal Ab (RanGAP1, N-19,
14 sc-1862; Santa Cruz) at 0.8 µg/ml. Subsequently, the wells were washed and then
15 incubated with 100 µl of goat IgG-HRP conjugate (1:2500, Dako) for 1 h at RT.
16 Between incubations, the plates were washed with PBS containing 0.05% Tween 20.
17 Finally, 100 µl of tetramethylbenzidine (TMB, ES001-500ML; Millipore, Billerica,
18 MA, USA) buffer was added to each well and incubated in the dark for 30 min. After
19 adding stop solution (2N H₂SO₄), the optical density (OD) was measured with a
20 spectrophotometer (µQuant, BIO-TEK instruments, Inc., Winooski, VT, USA) at 450
21 nm.

22 ***Transfecting RANGAP1-specific shRNA into cell lines***

23 The sequences for the RANGAP1 shRNA were as follows:

24 5'-GATCCCCAAGAGTGAAGACAAGGTCAATTCAAGAGATTGACCTTGTCT
25 TCACTCTGTTTGGAAA-3' (forward), and

1 5'-AGCTTTCCAAAAACAAGAGTGAAGACAAAGGTCAATCTCTGAATTGAC
2 CTTGTCTTCACTCTGGGG-3' (reverse). shRNAs were controlled for sequence
3 specificity using a BLAST search and did not show homology to other known human
4 genes. All shRNAs were purchased from Purigo Biotech (Taipei, Taiwan). The
5 plasmids expressing gene-specific shRNA were constructed using synthetic
6 oligonucleotides cloned into the *Bgl*II/*Hind*III cloning sites of the pSUPER-EGFP
7 vector (pSUPER RNAi System; OligoEngine, Seattle, WA, USA). Each of the
8 shRNA expression plasmids had a 21 nucleotide gene-specific target in both sense and
9 antisense orientation, separated by a 9 nucleotide spacer sequence. The 5' end
10 corresponded to the *Bgl*II site, while the 3' end contained the five-thymidine sequence
11 and *Hind*III-corresponding nucleotides. In all siRNA (small interfering RNA)
12 experiments, a control sample treated with empty vector was included. Other two sets
13 of siRNA sequences were as follows: siRNA1,
14 5'-GATCCCCGAACTTGTCATTCTGTGAAATTCAAGAGAATTACACAGAATG
15 ACAAGTTCTTTGGAAA-3' (forward), and
16 5'-AGCTTTCCAAAAAGAACCTGTCATTCTGTGAAATTCTCTTGAAATTCA
17 CAGAATGACAAGTCGGG-3' (reverse); siRNA2,
18 5'-GATCCCCCTGCCTCCTAAAGGTGTCATTCAAGAGAATGACACCTTAG
19 GAAGGCAGTTTTGGAAA-3' (forward), and
20 5'-AGCTTTCCAAAAACTGCCTCCTAAAGGTGTCATTCTCTTGAAATGACA
21 CCTTTAGGAAGGCAG GGG-3' (reverse).

22 An shRANGAP1 expression construct was transfected using an electroporation
23 machine (Microporator; Digital Bio Technology, Suwon, Korea) with 6-8 µg of DNA
24 at 1100-1300 V for 20-30 ms [23]. Transfection efficiency was determined by flow
25 cytometric analysis on fluorescent cells with a flow cytometer (FACSCalibur with

1 CellQuest Pro 4.0.2; Becton Dickinson, Franklin Lakes, NJ, USA) [27].

2 ***Quantitative real-time polymerase chain reaction (Q-PCR)***

3 Primers used for Q-PCR were described as followed: *Aurora-A* forward,

4 5'-AATGCCCTGTCTTACTGTCATT-3' and reverse,

5 5'-TCCAGAGATCCACCTTCTCATC-3'; *Aurora-B* forward, 5'-

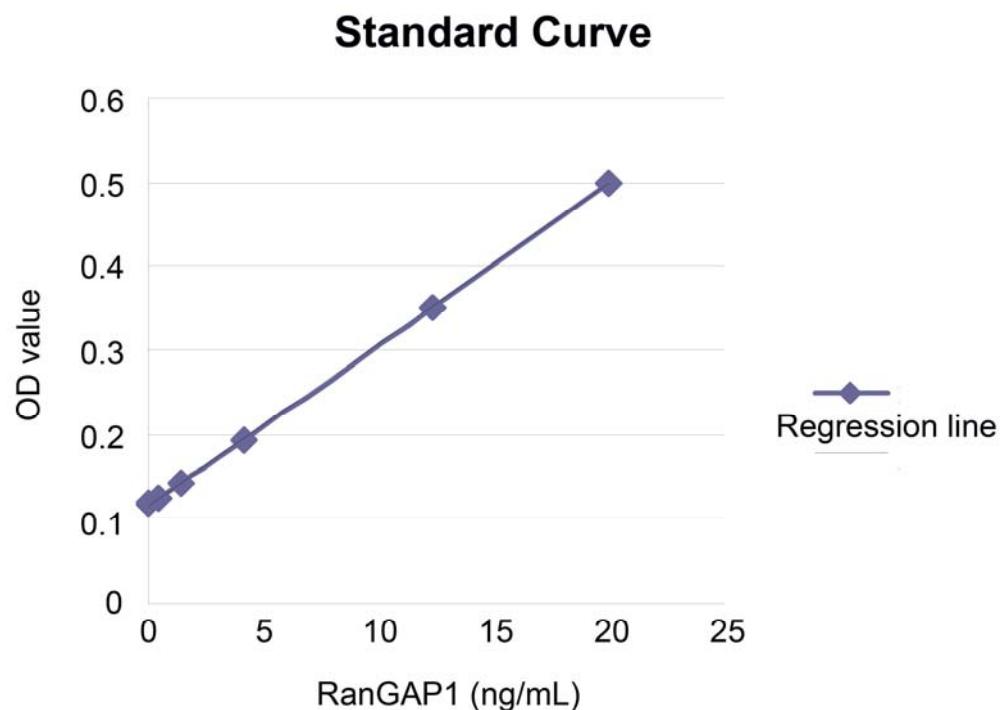

6 CATGGAGGAGTTGGCAGATGC-3' and reverse 5'-

7 TTAGGTCCACCTTGACGATGC-3'; *actin* forward,

8 5'-CTGGACTTCGAGCAAGAGATG-3' and reverse

9 5'-TGATGGAGTTGAAGGTAGTTCG-3'.

1 **Supporting Figure S1**

2 **Supporting Figure S1. The standard curve of RanGAP1 serum level.**

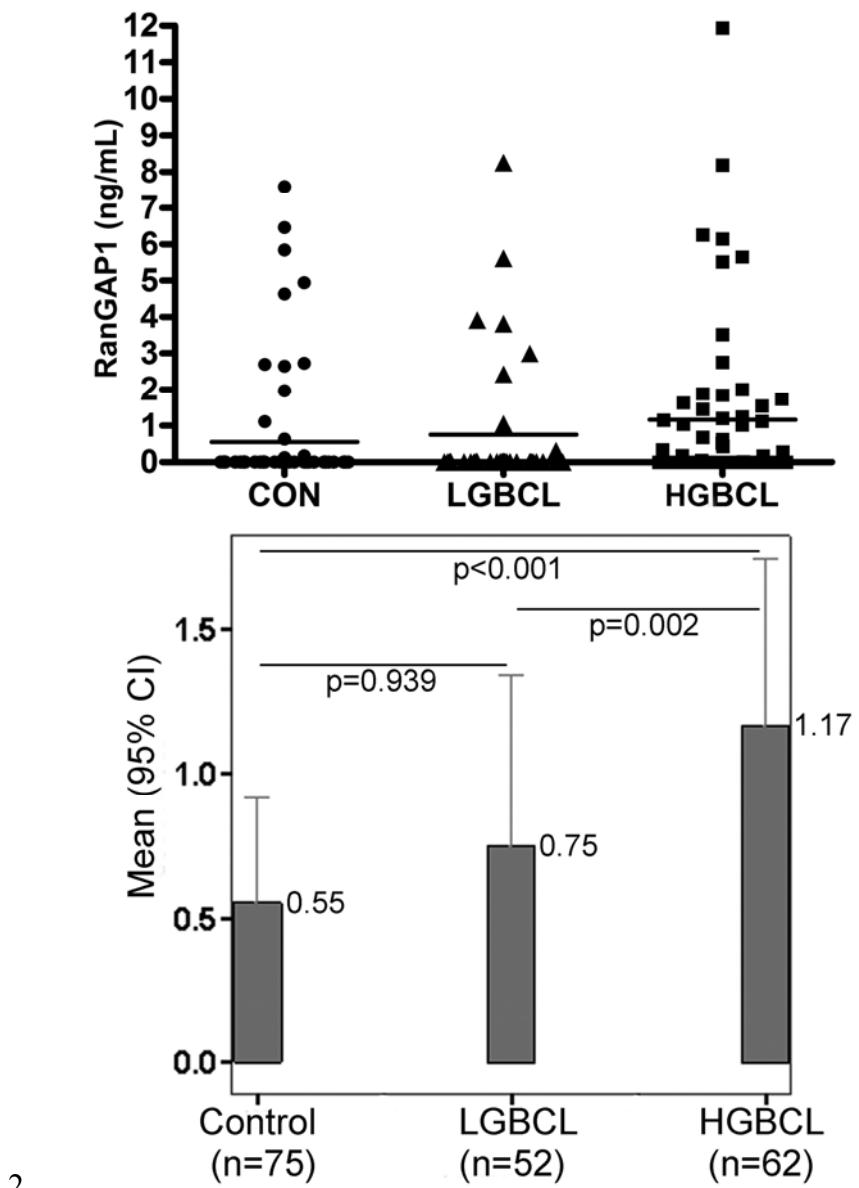

3 The colorimetric noncompetitive (immunometric sandwich assay) ELISA has been
4 developed and the standard curve was established by testing triplicates of serially
5 diluted standard. The detection range was 0-20 ng/mL (OD: 0.11-0.5). The regression
6 line formula is: $y=0.0191x+0.116$, $R^2=0.9998$.

7

8

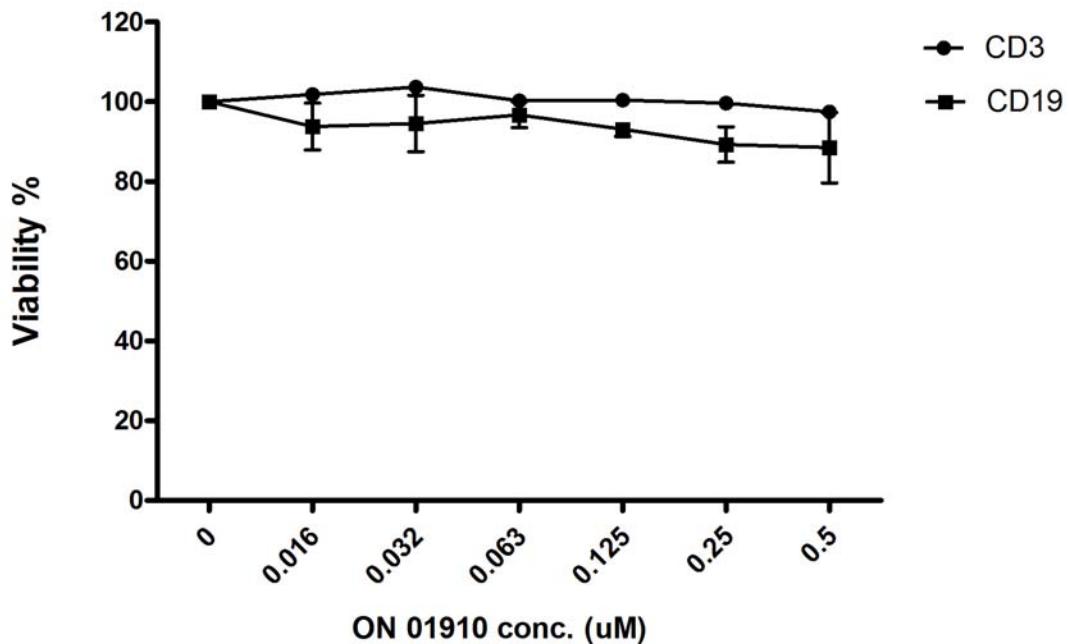

9

1 Supporting Figure S2.

2
3 **Supporting Figure S2. Higher serum level of RanGAP1 in patients with**
4 **high-grade BCL than in low-grade BCL and healthy controls.** Serum levels of
5 RanGAP1 were higher in patients with high-grade BCL (1.71 ± 2.28 ng/mL, n = 62)
6 than in low-grade BCL (0.75 ± 2.12 ng/mL, n = 52) and healthy controls (0.55 ± 1.58
7 ng/mL, n = 75) (high-grade BCL vs. low-grade BCL, $p = 0.002$; high-grade BCL vs.
8 control, $p < 0.001$, Mann-Whitney U test). However, the RanGAP1 serum level was
9 not so sensitive since half (n = 31) cases of high-grade BCL were not elevated.

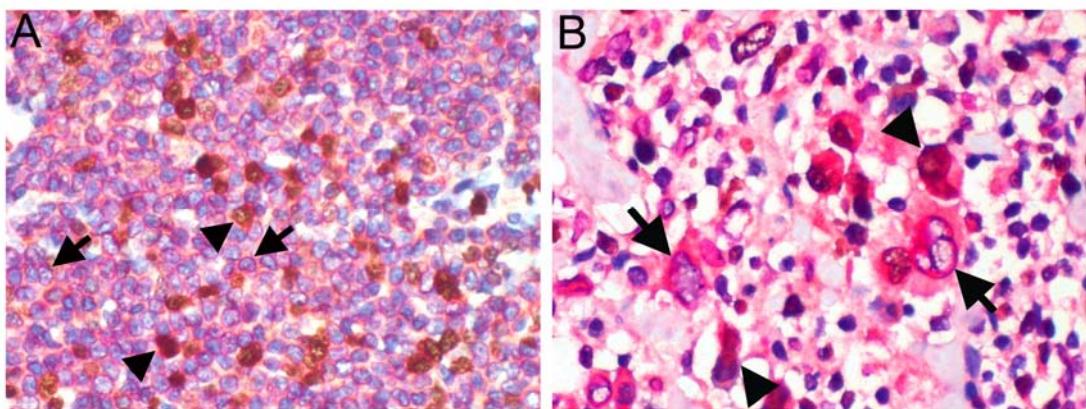

1 **Supporting Figure S3**

2

3 **Supporting Figure S3. No cytotoxic effect on B or T cells from healthy donors at**
4 **48 hours.** Peripheral blood mononuclear cells of healthy donors were treated with ON
5 01910.Na at increasing doses for 48 hours. Then, cell viability was assessed by flow
6 cytometry by gating $CD3^+$ T cells and $CD19^+$ B cells. The percentage of viable cells
7 normalized to the untreated control is shown.

1 **Supporting Figure S4**

3 **Supporting Figure S4. Double staining of RanGAP1 (red in cytoplasm) and**
4 **Ki-67 (a proliferation marker, brown in nuclei) in mantle cell lymphoma (A) and**
5 **Hodgkin lymphoma (B).** Many RanGAP1-positive tumor cells were negative for
6 Ki-67 staining in mantle cell (A, $\times 400$) and Hodgkin lymphomas (B, $\times 400$) (arrow:
7 RanGAP1 $^+$ /Ki-67 $^-$; arrowhead: RanGAP1 $^+$ /Ki-67 $^+$).
