***No. shared rels:** Number of genes (out of 20 possible) consistently and specifically coexpressed with the target gene that are associated with this entity

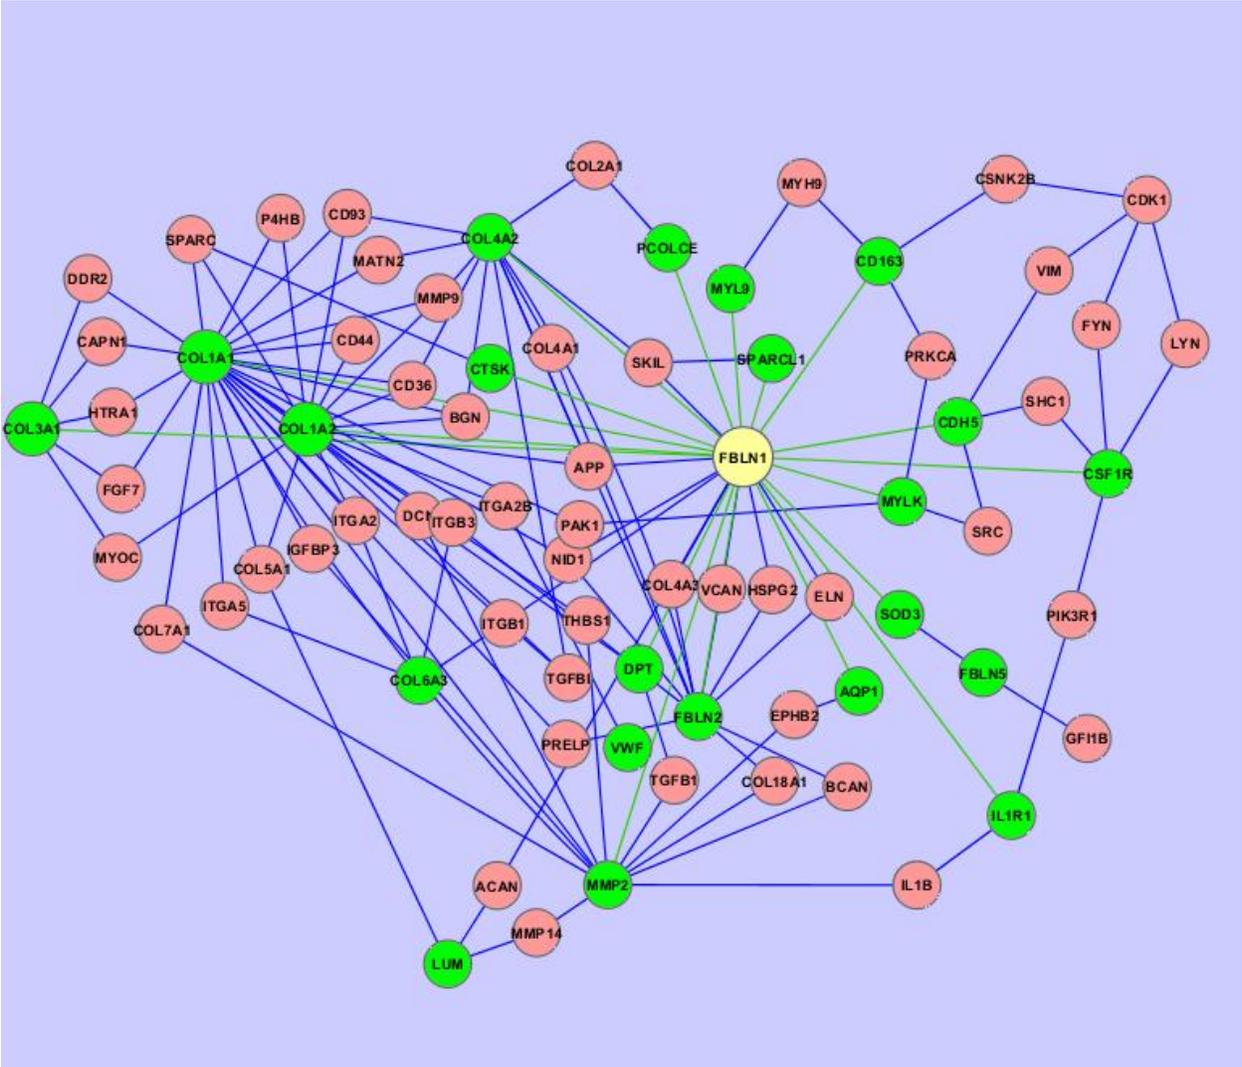

****Obs/Exp:** Statistical enrichment ratio—the number of observed commonalities to the number expected by chance alone, given a 20 identically connected genes within a random network of the same size

†Score: A priority score to rank the relative importance of the commonalities found

††Lit Str: If the predicted association is also a published association (i.e., apparently correct), Lit Str will be > 0. The higher this number, the more times the two terms are mentioned together in MEDLINE.

‡Lit MIM: Mutual information measure—a measure of how linked the two terms are in PubMed. The higher the value, the more the two terms are important to each other (e.g., insulin and glucose have a high MIM).

Supplementary Figure S1: Genes consistently coexpressed with FBLN1 (green nodes) and the protein–protein interactions they share (pink).

SPON1**Supplementary Table S2:** GAMMA-predicted genetic, phenotypic, and disease associations for SPON1

***No. shared rels:** Number of genes (out of 20 possible) consistently and specifically coexpressed with the target gene that are associated with this entity

****Obs/Exp:** Statistical enrichment ratio—the number of observed commonalities to the number expected by chance alone, given a 20 identically connected genes within a random network of the same size

†Score: A priority score to rank the relative importance of the commonalities found

††Lit Str: If the predicted association is also a published association (i.e., apparently correct), Lit Str will be > 0. The higher this number, the more times the two terms are mentioned together in MEDLINE.

¶Lit MIM: Mutual information measure—a measure of how linked the two terms are in PubMed. The higher the value, the more the two terms are important to each other (e.g., insulin and glucose have a high MIM).

LINGO1

***No. shared rels:** Number of genes (out of 20 possible) consistently and specifically coexpressed with the target gene that are associated with this entity

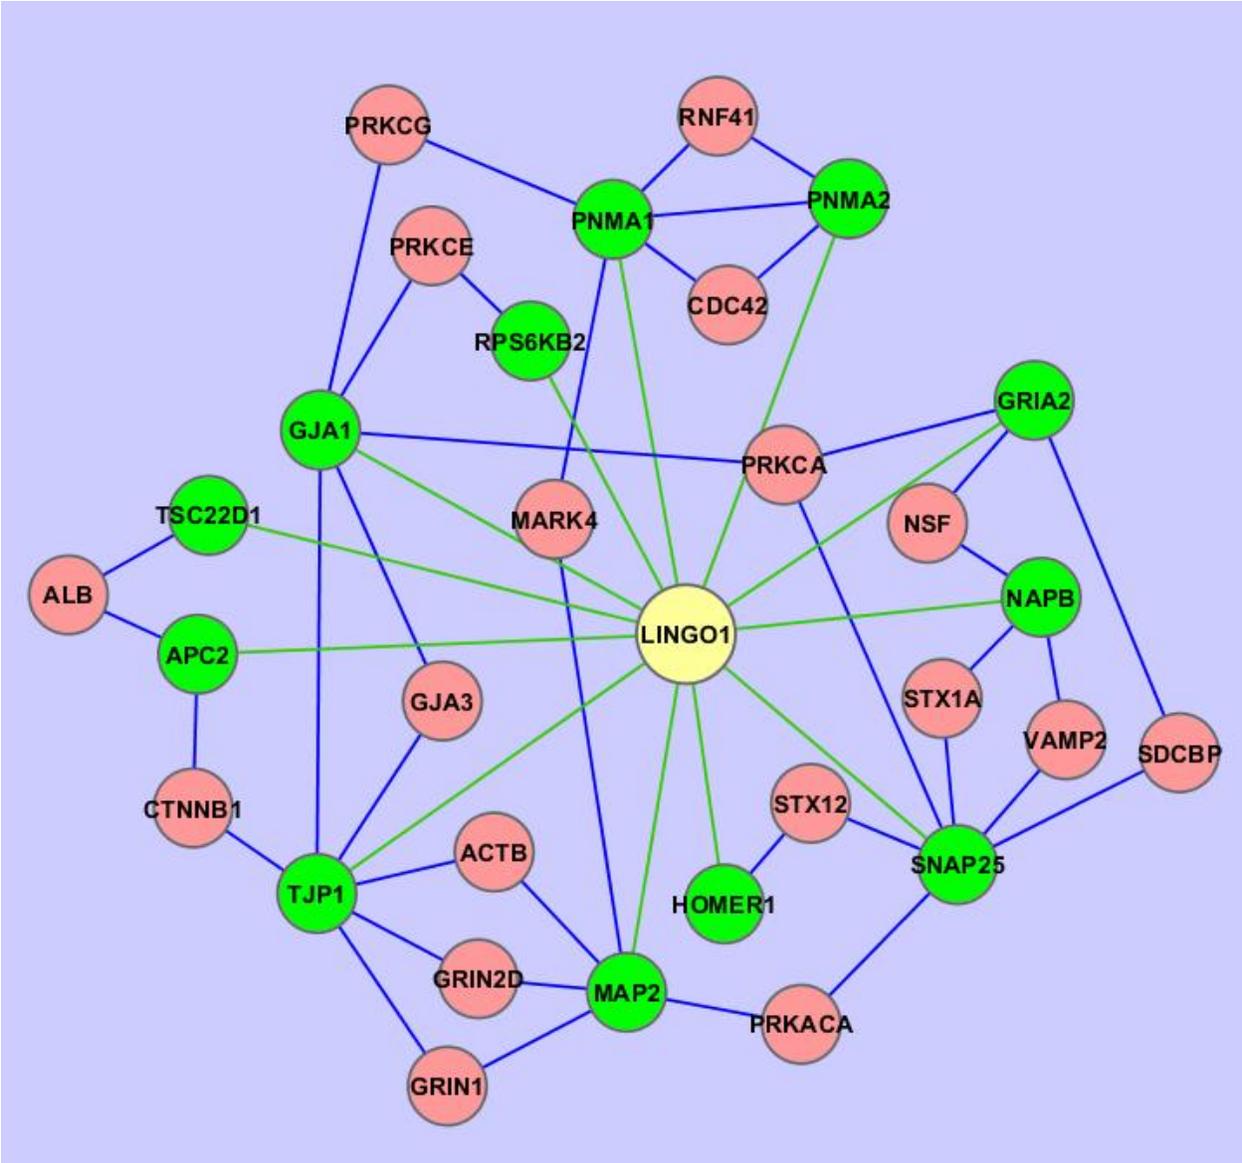

****Obs/Exp:** Statistical enrichment ratio—the number of observed commonalities to the number expected by chance alone, given a 20 identically connected genes within a random network of the same size

†Score: A priority score to rank the relative importance of the commonalities found

††Lit Str: If the predicted association is also a published association (i.e., apparently correct), Lit Str will be > 0. The higher this number, the more times the two terms are mentioned together in MEDLINE.

‡Lit MIM: Mutual information measure—a measure of how linked the two terms are in PubMed. The higher the value, the more the two terms are important to each other (e.g., insulin and glucose have a high MIM).

Supplementary Figure S5: Genes consistently coexpressed with PLXNB2 (green nodes) and the protein–protein interactions they share (pink)
