

Fig.s1. Detection EXO using a FACS method. Aldehyde/Sulfate latex beads (4 μm) were first coated with anti-CD81/63 antibodies, followed by blocking with glycine. The coated beads were incubated with either PBS (A) or 5 μg of purified MIN6 EXO (B), and stained with anti-CD81-PE. (C) Latex beads were not coated with the anti-CD81/63 antibodies, but blocked with glycine before incubating with 5 μg of purified MIN6 EXO, followed by staining with anti-CD81-PE.
