¹Protein sequence number as defined in Supplemental Table 2.

²The protein family domains, GRAVY (grand average of hydropathy), and predicted subcellular localization for *Arabidopsis* LEA proteins were obtained from Hundertmark and Hincha (2008).

³Representative of putative *T. salsuginea* LEA proteins that showed distinct sequence models.

⁴GRAVY quantitates the hydrophilicity of proteins based on amino acid composition using the protparam algorithm (<http://web.expasy.org/protparam/>). Subcellular localization was predicted from protein sequence analysis using the targetP algorithm.

Empty cells indicate no orthologous protein was found for *T. salsuginea* in the sequence assembly.

Bold numbers indicate complete coding region for *Arabidopsis* and predicted to be complete coding region for *T. salsuginea* based on protein sequence alignment between the two species.
