LNCaP cells were transfected by nucleofection with C/EBP α or vector. After 24h, the cells were infected with AR shRNA lentivirus or non-target control lentivirus; the cells were then grown in fresh hormone-free media. The cells were then treated for 48 h with either vehicle or R1881 (1 nM). The cells were harvested 72 h post nucleofection and the mRNA profile was determined using replicate samples by Affymetrix microarray analysis. The AR knockdown accomplished by infection with shRNA lentivirus was 100% (please see Figure 5B in the manuscript). 50% of the cells were transfected by nucleofection with the C/EBP α expression plasmid, as determined by co-transfected GFP. The Table only includes genes that were unresponsive to R1881/AR. The Table shows the fold increase in gene expression which was dependent on the presence of both AR and C/EBP α . Significant increases in expression in AR $^+$ C/EBP α $^+$ R1881-treated cells compared to AR $^-$ C/EBP α $^+$ vehicle-treated cells were determined using the affylmGUI program. The fold-changes and *P*-values for these increases were determined by the affylmGUI program. An adjusted fold-change was also calculated to compensate for the fact that only 50% of the cells were transfected by the C/EBP α expression plasmid. The list was filtered to remove all probe sets with activation by (AR + R1881)/AR $^-$ control >1.2 , those with average expression levels <64 , and those with *P* - values for increase >0.01 . The adjusted increases for the 100 genes with the greatest increases are shown in this Table.
