

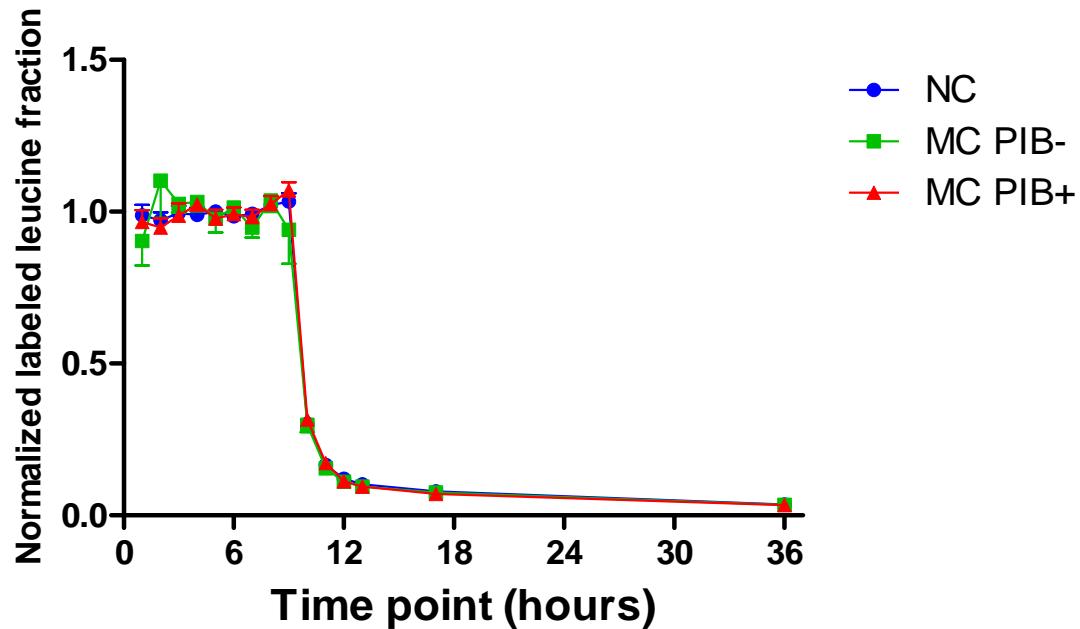

Fig. S1. Time course of plasma leucine isotopic enrichment

Plasma leucine enrichment was normalized to the enrichment plateau, and compared by mutation status (NC = non-mutation carriers; MC = mutation carriers) and amyloid deposition (PIB- or PIB+). Error bars represent SEM.

Fig. S4. Isotopic enrichment time courses of CSF A β peptides in individual non-mutation carrier subjects

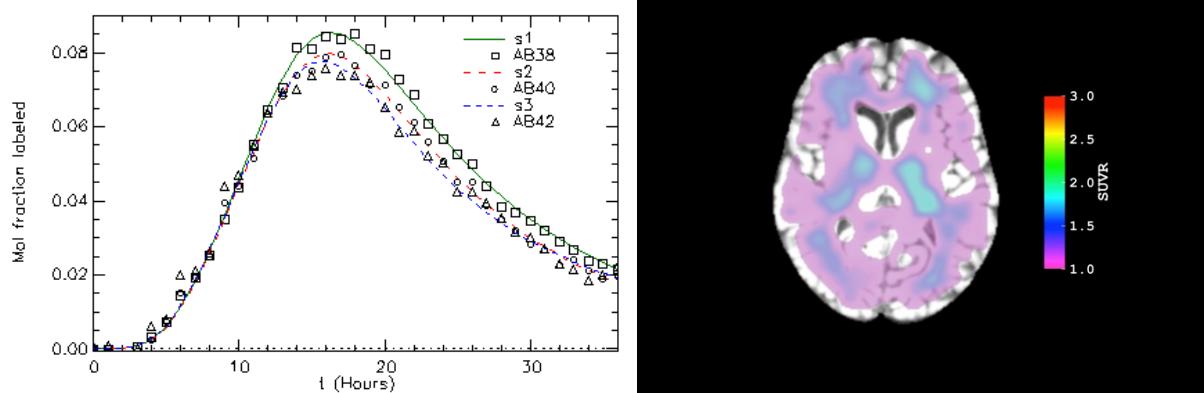

The PIB mean cortical binding potential score, the ratio of A β 42:A β 40 total fractional turnover rates (FTR), the ratio of CSF A β 42:A β 40 concentrations, and the presence or absence of the exchange process for A β 42 revealed by the model are also tabulated for each participant. Summary values of these measures are tabulated after the last participant within the group. The isotopic enrichment time courses of A β 38 (squares, solid green line), 40 (circles, dashed red line), and 42 (triangles, dashed blue line) are presented for each participant. Lines represent model fits to each participant's data. An image with PET-PIB labeling superimposed over MRI is also shown for each participant. PIB images are displayed as Standardized Uptake Value Ratios (SUVRs) with the cerebellar gray matter used as the reference tissue.

PIB MCBP score= 0.026

A β 42:A β 40 FTR ratio: 1.06

Fig. S7. Scatterplot of concentrations and selected kinetic parameters

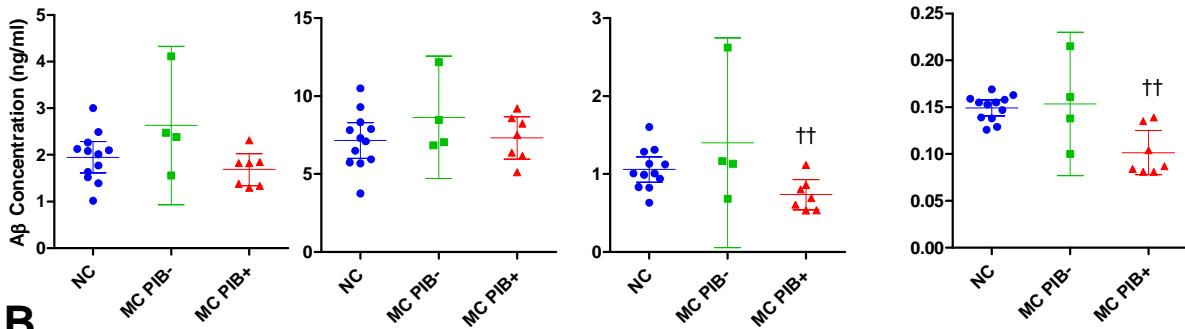

A

A β 38

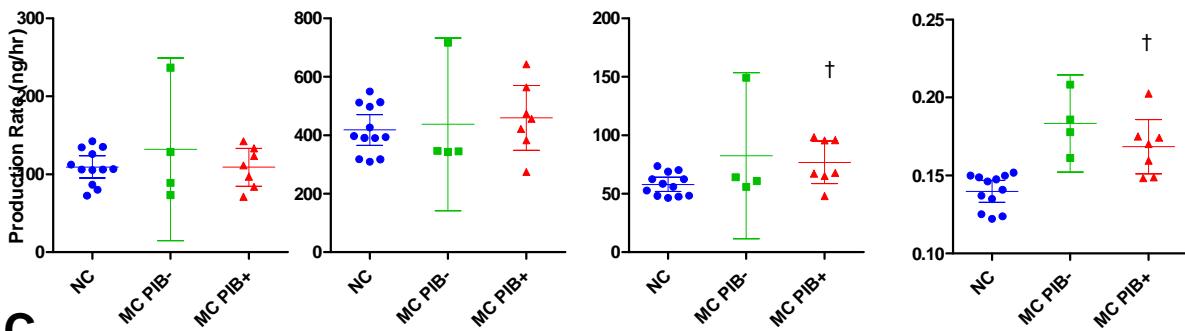

A β 40

A β 42

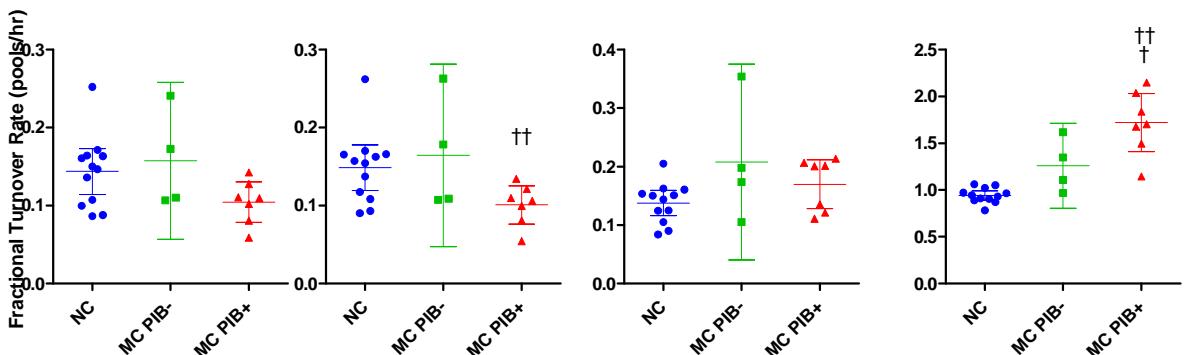

A β 42:40

B

C

Parameters for baseline CSF A β concentrations (A), production rate (B), and fractional turnover rate (FTR) (C) are shown for each individual non-mutation carrier (NC), and for mutation carriers (MC) without (PIB-) or with (PIB+) evidence of amyloid deposition. Each parameter was measured for A β 38 (1st column), A β 40 (2nd column), A β 42 (3rd column) and the A β 42:40 ratio (4th column), and compared by mutation status and amyloid deposition. Error bars indicate 95% CI. Statistical significance based on mutation status (†) and PIB MCBP score (††) are indicated.

Video file: A β 42 and A β 40 Stable Isotope Labeling Kinetic model in the CNS of PS1 and PS2 mutation carriers.

The model compartments for soluble, exchange, and irreversible loss of A β are displayed on a template MRI image with a hypothesized soluble compartment throughout the CNS, and exchange and irreversible loss around fibrillar plaques (in purple). Location of fibrillar plaques was determined using the average PiB image for PiB+ mutation carriers. Note: labeled A β pools have exaggerated spatial scale for visual comparison.
