**Supplementary Figure 1. Generation of RAW267.4 macrophages expressing TAP-Ub** (a) Topology of the Tandem-affinity tagged (TAP)-Ubiquitin expression construct expressed by the RAW-Ub macrophages. Ubiquitin was fused to 3XFlag, 6XHistidine and a 75-aa biotinylation motif derived from a *Propionibacterium shermanii* transcarboxylase (b) Immunofluorescence micrographs of parental and derived stable cell lines expressing TAP-Ubiquitin stained with anti-Flag antibody (c and d) WT but not the UB<sub>G76V</sub> Ubiquitin mutant is conjugation competent (c) Immunoblot analysis of TAP-Ub incorporation in ubiquitin conjugates from lysates of stable cell lines uninfected (UI), infected with *Legionella* (LP) or dotA for 4hrs [MOI=40]. (d) The conjugation competent TAP-Ub allele phenocopies endogenous ubiquitin and accumulates on the *Legionella*-containing vacuole in infected RAW-Ub cells. (e) Experimental setup used for identification of ubiquitin-regulated responses in RAW-Ub cell infected with different *Legionella* strains for 4hrs [MOI=40]. Cell lysis and protein affinity purification were completed in highly denaturing conditions with a buffer containing 8M Urea to preserve protein post translational modifications.

Network was constructed by the addition of known interactors one degree removed from the experimental nodes (InnateDB database). (b) Power law curve fitted node degree distribution (correlation = 0.878) and neighborhood connectivity distribution (correlation = 0.539) of the total network. (c) Force-directed layout of the pathogen-induced response network. (d) Grid layout of the PI3K-AKT-mTOR, NF-κB and RIG-I sub-network. Nodes identified by proteomics analysis are highlighted. (e) Cellular pathways (PID NCI database) over-represented in the pathogen-specific network generated using hypergeometric algorithm (InnateDB) based on the number of pathway components represented within the network. Translocation of the β-lactamase fusion protein in the cytosol of infected cells by the *Legionella* T4SS causes CCF2 cleavage and shift in fluorescence emission from 535nm to 455nm. (b-c) Representative FACs sort of BMMs infected with either wt (T4SS+) or dotA (T4SS-) strains expressing β-lactamase-RalF fusion. Pre-sort (b) and post-sort (c) analysis of infected BMMs.

**Supplementary Figure 6. Structural and functional analysis of the 5'UTR of cytokine mRNAs** (a) 5'UTR nucleotide sequence of several pro- and anti-inflammatory cytokine mRNAs. (b) Cytokine genes lack 5'-Terminal Oligopyrimidine sequences (TOPs). Pyrimidines, highlighted in red, are not enriched in the 5' UTRs of cytokine mRNAs. Translation of TOPs-containing mRNAs is sensitive to mTOR suppression. Genes encoding bona fide TOPs are shown. (c) The 5' UTR length for most cytokine mRNA is shorter than the length average for the mouse genome. (d) Expression of luciferase fused to the 5' UTR of mouse *II6*, *II10* or picornavirus IRES sequence in HK293 cells transfected for 6 hrs. Inhibitors were added at 2 hrs post transfection. Luciferase assays were normalized to vehicle controls and represent average of triplicates + standard deviation.

**Supplementary Figure 7. Host responses regulated by Akt and translation in *Legionella* infections** (a-c) Cytokine responses in infected BMMs. Average values of technical replicates + s.d. are shown (\*) p < 0.05 (paired T-test) (a) Secretion of CCL2 induced by LP or dotA [MOI=3 or 6] (b-c) ELISA of secreted IL-1 $\beta$  (b) and IL-1 $\alpha$  (c) produced by BMMs infected as indicated for 18hrs followed stimulation with ATP [1mM] for 30min. Averages of technical replicates + s.d. Significance is indicated between cells infected with LP compared to dotA infections (\*) p < 0.05 (\*\*) p < 0.005. (d-f) Changes in Calnexin expression induced by LP infection. (d) Canx and II6 mRNA in BMMs infected as indicated for 4hrs [MOI = 20] or stimulated with LPS [100ng/ml] as determined by qPCR. Relative abundance for each transcript shown was normalized to Gapdh mRNA. (e) Induction of Calnexin protein in LP infections [7hrs, MOI=10]. (f) Calnexin turnover in BMMs treated with cycloheximide [50 $\mu$ g/ml] and infected as indicated. (g) Type I interferon activity secreted by BMMs infected as indicated as determined by a bioassay. Average values of technical replicates + s.d. are shown (\*) p=0.01 (paired T-test) (h) Schematic of lysine residues on Akt1 ubiquitinated in response to pathogenic *Legionella* that were mutated to argenines in the KR allele. Representative micrographs of J774 mouse macrophage cell lines stably expressing myrGFP, myrGFP-Akt1 or myrGFP-Akt1 KR alleles (i) The proteasome inhibitor MG-132 rescued the loss of phosphorylated myrGFP-Akt1 triggered by LP infection, whereas the phosphorylated KR allele was unaffected. J774 cells stably expressing myrGFP-Akt1 or the myrGFP-Akt1 KR allele were infected in the presence/absence of MG-132 [25 $\mu$ g/ml] for 2hrs [MOI=15]. (j) Model depicting how an mTOR rheostat is tuned in response to pathogen infection. During infection by a pathogenic microbe such as virulent *Legionella*, mTOR activity is suppressed and cap-dependent translation is low. These conditions favor expression of the highly abundant transcripts encoding pro-inflammatory cytokines. During infection by a non-pathogenic microbe, such as dotA, mTOR activity and translational initiation is high, and low abundance transcripts encoding immunosuppressive cytokines can be translated, which balances the inflammatory response to prevent host damage.
