

**Supplementary Table 2 : Immunohistochemical evaluation of IL-33/ST2 staining on sections of macroscopically non-involved colon areas from IBD patients with active disease. (A) Characteristics of patients with CD or UC. (B) Compiled immunohistochemistry results for IL-33 on sections from human colon. Data represent fraction of blocks that stained positive for IL-33 on the respective cell type.**

**A)**

	<b>Non-involved colons of CD</b>	<b>Non-involved colons of UC</b>
<b>Number of individuals</b>	7	5
<b>Male:female</b>	4:3	4 :1
<b>Median age (range)</b>	59 (43-74)	43 (21-76)
<b>Number of blocks</b>	12	7
<b>Of which</b>		
<b>Biopsies</b>	6	5
<b>Resections</b>	6	2

**B)**

	<b>Non-involved colons of CD</b>	<b>Non-involved colons of UC</b>
<b>Epithelium</b>	0/12	0/7
<b>Inflammatory Infiltrate</b>	-	-
<b>Muscle cells, fibroblasts</b>	1/12	0/7
<b>Single myeloid/lymphoid cells in lamina propria</b>	7/12	2/7
