Table S4. Housekeeping genes have the most CpG DNA methylation. As found previously, the genes with high o/e ratios are primarily housekeeping genes (1-3) (Table S2). By ‘housekeeping’ genes, we mean genes that encode proteins with a higher degree of conservation than proteins encoded by non-methylated genes (4). Highly conserved genes are utilized in most tissues, whereas less conserved genes are typically expressed in specialized tissues. Examples are the genes coding for odorant-binding proteins or odorant receptors (5), which are not methylated (not shown, see also (3)).
