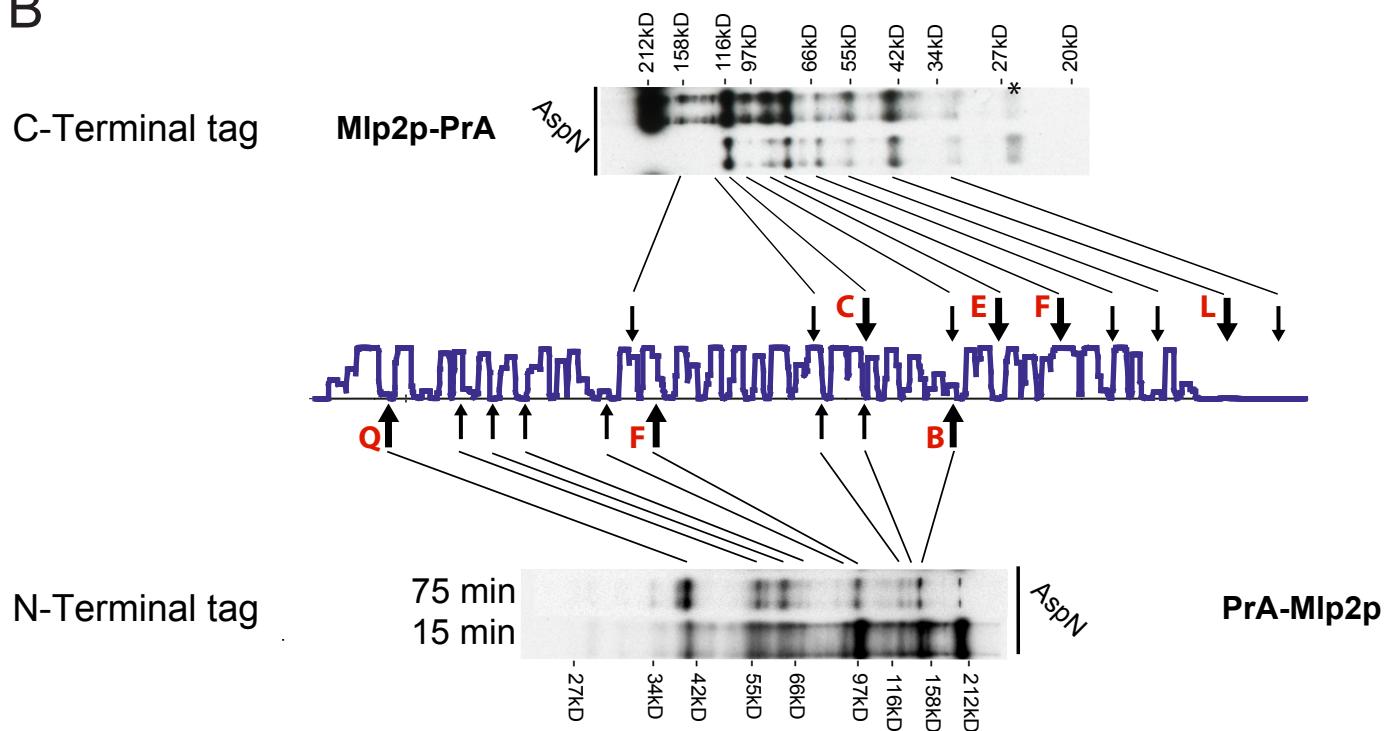

Figure S1. The coiled-coil region of both Mlp proteins contains multiple discontinuities and protease sensitive regions. Protease accessibility laddering (PAL) of (A) Mlp1p and (B) Mlp2p shows that sites of AspN protease cleavage, indicated above and below PAGE panels (vertical arrows), correspond to PARCOIL-predicted discontinuities in coiled-coil formation as calculated using 14-aa sliding windows. Arrow sizes represent relative degrees of protease sensitivity at the indicated sites, measured by quantifying the band intensity of individual protease fragments. The complete list of the AspN protease fragments with the corresponding estimated molecular weights and cleavage sites is listed in Table S6. Labels on the arrows correspond to labels in Table S6.

Figure S2. The nuclear basket keeps the central NPC transporter clear of RNA-rich electron-dense particles. (Left panels) Bernhard's EDTA-stained thin-section electron micrographs of four NPCs showing electron-dense RNA-rich particles (blue arrows), docking at or traversing through NPCs in (A) wild type and (B) *mlp1Δmlp2Δ* cells. In wild type cells, electron-dense particles are found near the distal ring at the nuclear basket. In *mlp1Δmlp2Δ* cells the particles appear to be closer to if not overlapping with the the NPC central tube. (Right panels) Overlays of multiple Bernhard's EDTA-stained images show that in *mlp1Δmlp2Δ* cells the nuclear face of NPCs appear to be significantly more crowded with RNA-containing electron-dense material than in wild type cells (red arrows). Bar: 100 nm.
