## Table of contents:

<b>Figure S1.</b> Histograms of the genetic differentiation estimates of each of 2880 SNPs, for each selection method and population dataset (x-axis scale is method-specific). The majority of the SNPs display low to moderate estimates of genetic differentiation and only a small proportion of SNPs display high levels of population differentiation	2
<b>Figure S2.</b> Overall assignment success with 31 STRs and additional top-ranked SNPs selected by global $F_{ST}$ (dashed line), pairwise $F_{ST}$ (solid line), <i>Delta</i> (long dash and dotted line) and outlier methods (dataset I)	3
<b>Table S1.</b> Microsatellite loci sequencing details and genetic diversity indices: $A_T$ – total number of alleles, $A_R$ – allelic richness, $H_O$ – observed heterozygosity, $H_E$ – expected heterozygosity, $F_{ST}$ – genetic differentiation	4
<b>Table S2.</b> Comparison of GSI accuracy (%) achieved using mixtures of fish with varying compositions in ONCOR [31], and using two alternative assignment approaches of Rannala & Mountain [32] and Paetkau et al. (1996). SNPs were ranked using pairwise $F_{ST}$ selection method, dataset II	5
<b>Table S3.</b> Genetic distances (Reynolds et al. 1983) among 23 Atlantic salmon populations estimated on the basis of 2880 SNP (above diagonal) and 31 STR (below diagonal) markers	6
<b>Table S4.</b> Overall assignment success (%) for 50 and 100 top SNPs identified using different approaches depending on the population dataset	7
<b>Table S5.</b> GSI accuracy (%) in individual population	8
<b>Table S6.</b> GSI accuracy (%) of SNPs ranked using pairwise $F_{ST}$ (dataset II) tested on 26 independent individual populations (DRYAD entry doi:10.5061/dryad.gm367, Bourret et al. 2012)	13
<b>Table S7.</b> Estimated number of SNPs required to achieve 80%, 90%, 95% and 98% overall correct assignments for independent dataset of 26 European Atlantic salmon populations	14

**Figure S1.** Histograms of the genetic differentiation estimates of each of 2880 SNPs, for each selection method and population dataset (x-axis scale is method-specific). The majority of the SNPs display low to moderate estimates of genetic differentiation and only a small proportion of SNPs display high levels of population differentiation.

**Figure S2.** Overall assignment success with 31 STRs and additional top-ranked SNPs selected by global  $F_{ST}$  (dashed line), pairwise  $F_{ST}$  (solid line), *Delta* (long dash and dotted line) and outlier methods (dataset I).

**Table S1.** Microsatellite loci sequencing details and genetic diversity indices:  $A_T$  – total number of alleles,  $A_R$  – allelic richness,  $H_O$  – observed heterozygosity,  $H_E$  – expected heterozygosity,  $F_{ST}$  – genetic differentiation.

Marker	Reference	Primer sequences	$A_T$	$A_R$	$H_O$	$H_E$	$F_{ST}$
