

**Supplemental Figure 1. Clinical assessment of CIA after adoptive transfer of CD4, CD4+CD25<sup>-</sup> and CD4+CD25<sup>+</sup> T cells.** The two experimental groups were transferred different T cell subsets from CIA and TCV-treated mice. Mice of each group were adoptive transferred with CD4<sup>+</sup>, CD4+CD25<sup>-</sup> and CD4+CD25<sup>+</sup> T cells, respectively. After 14 days, clinical scores were assessed. Data are represented as means  $\pm$  SD (n=5 mice/group). Data are representative of 3 separate experiments with similar results. \*P<0.05, CD4+CD25<sup>-</sup> vs. CD4+T cells adoptive transfer. #P<0.05, CD4+CD25<sup>+</sup> vs. CD4+T cells adoptive transfer. \$P<0.05, CD4+CD25<sup>-</sup> vs. CD4+CD25<sup>-</sup>T cells adoptive transfer.
