Table A3. List of all competitive models identified for nymph density, ranked by ΔAIC_c . The selected model, used in prediction, is indicated with boldface. All models included year, week, latitude, and longitude.

Nymph model; additional covariables included	Parameters	ΔAIC_c	R^2
Summer prec, min winter temp, forest	9	0	0.642
Summer prec, min winter temp, forest, forest border/area	10	0.8929	0.654
Summer prec, min winter temp, forest, forest border/area, area forest patch (100 m radio)	10	0.9238	0.653
Week ² , summer prec, min winter temp, forest	10	1.2927	0.651
Year ² , summer prec, min winter temp, forest	10	1.5904	0.648
Summer prec, min winter temp, forest ^{int} , forest border/area ^{int}	11	1.7230	0.665
Summer prec, min winter temp, forest, urban	10	1.9315	0.646

Notes: Abbreviations are: prec: precipitation; min: minimum; temp: temperature. Superscript *int* marks interactions between variables. Superscript 2 indicates additional quadratic term.

Table A4. List of all competitive models identified for adult density, ranked by ΔAIC_c . The selected model, used in prediction, is indicated with boldface. All models included year, week, latitude, and longitude.

Adult model; additional covariates included	Parameters	ΔAIC_c	R^2
Winter prec, min winter temp, forest^{int}, urban^{int}	11	0	0.622
Air temp during collection, winter prec, min winter temp, forest ^{int} , urban ^{int}	12	0.0328	0.633
Annual prec, min winter temp, forest ^{int} , urban ^{int}	11	0.3530	0.620
Air temp during collection, humidity during collection, winter prec, min winter temp, forest ^{int} , urban ^{int}	13	0.5026	0.643
Air temp during collection ^{int(1)} , humidity during collection ^{int(1)} , winter prec, min winter temp, forest ^{int(2)} , urban ^{int(2)}	14	0.6625	0.653
Winter prec, min winter temp, forest ^{int} , urban ^{int} , area forest patch (500 m radio)	12	0.7718	0.630
Year ² , week ² , winter prec, min winter temp, forest ^{int} , urban ^{int}	13	0.8805	0.641
Humidity during collection, winter prec, min winter temp, forest ^{int} , urban ^{int} , forest border/area	13	1.0536	0.64
Winter prec, min winter temp, forest ^{int} , urban ^{int} , area forest patch (50 m radio)	12	1.1198	0.628
Week ² , winter prec, min winter temp, forest ^{int} , urban ^{int} ,	12	1.2994	0.630
Air temp during collection, winter prec, min winter temp, forest ^{int} , urban ^{int} , forest border/area	13	1.3167	0.639
Winter prec, forest ^{int} , urban ^{int} , area forest patch (100 m radio)	12	1.3411	0.627
Annual prec, annual temp, forest ^{int} , urban ^{int}	11	1.4058	0.614
Winter prec, min winter temp, forest ^{int} , urban ^{int}	12	1.6074	0.625
Winter prec, annual temp, forest ^{int} , urban ^{int}	11	1.7159	0.613
Air temp during collection, humidity during collection, winter prec, min winter temp, forest border/area	14	1.7981	0.648
Week ² , air temp during collection ^{int(1)} , humidity during collection ^{int(1)} , winter prec, min winter temp, forest ^{int(2)} , urban ^{int(2)}	15	1.8734	0.659

Notes: Abbreviations are: prec, precipitation; min, minimum; temp, temperature. Superscript int marks interactions between variables. Superscript 2 indicates additional quadratic term.

Table A5. In order to assess the robustness of our models to uneven sampling, we randomly selected subsets from each dataset to create datasets with locations evenly stratified by latitude. These subsets represent 60.9% and 41.42% of the dataset originally used for model development of nymphs and adults, respectively. The parameters estimates obtained with such unbiased subsets are remarkably similar to those obtained with the full dataset. The unbiased nymph model (Regression model for nymph density estimates using a randomly selected subset evenly stratified by latitude; $R^2 = 0.604$, $F = 12.874$, $df = 58$, $P < 0.0001$), with roughly 60% of the data points, is practically identical to the original (see Table 2). Two of the covariates (longitude and summer precipitations) are not significant after Bonferroni corrections when compared with the original model. The unbiased adult model (Regression model for adult density estimates using a randomly selected subset evenly stratified by latitude; $R^2 = 0.76$, $F = 21.151$, $df = 60$, $P < 0.0001$), with roughly 40% of the data points, is similar to the original (see Table 2). Although exact parameters estimates and significance differ slightly, the relative effects and directions of each one are similar.
