

Supplemental Figure 1. *DR5rev:GFP* expression after IAA and oxIAA treatment.

Pictures of root tips from 4-DAG *Arabidopsis* seedlings expressing *DR5rev:GFP* after 4h (A) and 24h (B) treatment with 0 (control), 1, 10 or 100 μ M IAA or oxIAA.

Fluorescence intensity measured over the meristematic zone of the primary root apex after 4h (C) and 24h (D) treatment with 0 (control), 1, 10 and 100 μ M IAA or oxIAA. Error bars indicate standard deviation ($n=15$). The asterisks denote a significant difference between the control (Ctrl) and the treated samples using Student's t-Test (* $p<0.05$, *** $p<0.001$).

Supplemental Figure 2. Activity of IAA and oxIAA in hypocotyl elongation assays.

Hypocotyl elongation was measured after treating 5-DAG wild type *Arabidopsis* Col-0 seedlings with different concentrations of IAA or oxIAA for 48 hours. IAA induced hypocotyl elongation in concentrations between 0.5 and 50 μ M. OxIAA had no significant effect on hypocotyl elongation at the concentrations tested (up to 1000 μ M). Error bars indicate standard error (n=24).
