

Supplementary Figure 1. Level of leukocyte invasion and inflammation in the muscularis propria. Panel A: Leukocyte invasion was measured from CD11b immunofluorescence in normal intestine and compared to normal resection margin and strictured intestine in the same patients. Panel B: was measured from MPO activity in normal intestine and compared to normal resection margin and strictured intestine in the same patients. Results represent the mean \pm SE of 9 separate patients. * denotes $P < 0.05$ vs normal resection margin.
