## Supplemental Figure S1

### Supplemental Figure S1: Gene editing of HCT116-19 cells using TALENs and ssODNs.

Unsynchronized HCT116-19 cells were harvested and electroporated at a concentration of  $5 \times 10^5$  cells/100ul with the indicated TALEN pair and/or various ssODN concentrations. TALEN amounts reflect the total TALEN plasmid added to each sample in equal portions. Following electroporation, cells were placed in 6-well plates and allowed to recover for 48 hours. Analysis took place on a Guava EasyCyte 5HT flow cytometer (see materials and methods section). Correction efficiency (%) was determined by the number of viable eGFP positive cells divided by the total number of viable cells in the population. Each treatment was performed in triplicate and error bars represent standard error.

## Supplemental Figure S2

### Supplemental Figure S2: Unprotected ssODN and TALENs also support gene editing.

Unsynchronized HCT116-19 cells were harvested and electroporated at a concentration of  $5 \times 10^5$  cells/100ul with 2ug TALEN (1ug L848-19 and 1ug R898-19) and the above indicated amount of single stranded, unmodified oligonucleotide 72NT-U. Following electroporation, cells were placed in 6-well plates and allowed to recover for 48 hours. Analysis took place on a Guava EasyCyte 5HT flow cytometer (see materials and methods section). Correction efficiency (%) was determined by the number of viable eGFP positive cells divided by the total number of viable cells in the population. Each treatment was performed in triplicate and error bars represent standard error
