

Additional file 2. Comparison of significant results in HIV negative patients, using either pre- or post-vaccination data. (PDF file)

	Pre dataset	<i>P</i>	Post dataset	<i>P</i>
Difference in mean VH (μm)	56.8	0.006	65.2	0.002
Difference in median VP (μm)	81.3	0.003	151.4	0.002
Difference in mean VA (μm)	5973	0.03	8600	0.008

Comparison of significant results in HIV negative patients, using a dataset including either pre- or post-vaccination data in 14/38 patients where data was available for both time points. Results show differences and *P* values comparing HIV negative patients given MM versus placebo. There remained no significant differences in crypt depth or villous width, or in any variables in HIV positive patients. MM, multiple micronutrient supplementation; VA, villous area; VH, villous height; VP, villous perimeter.
