Supplementary Figure 1. Chromosome-wide 5hmC densities in wild-type and rCGG mice cerebella. Chromosome-wide densities were determined as reads per chromosome divided by the total number of reads in millions. Expected values were determined by dividing 10^6 by the total genome length and multiplying by chromosome length.

Supplementary Figure 2. Differential 5hmC distribution on various CpG density promoters. (A-C) Normalized 5hmC read densities on promoters with differential CGI abundance. Wild-type and rCGG 5hmC were separately plotted **(A-B)** or combined together **(C)**.

Supplementary Figure 3. Mouse phenotype predictions for defined DhMRs. (A-B) Identified DhMRs were predicted for associated mouse genotypes using the GREAT tool.

Supplementary Table 1. Sequencing information for each biological replicate and combined samples.

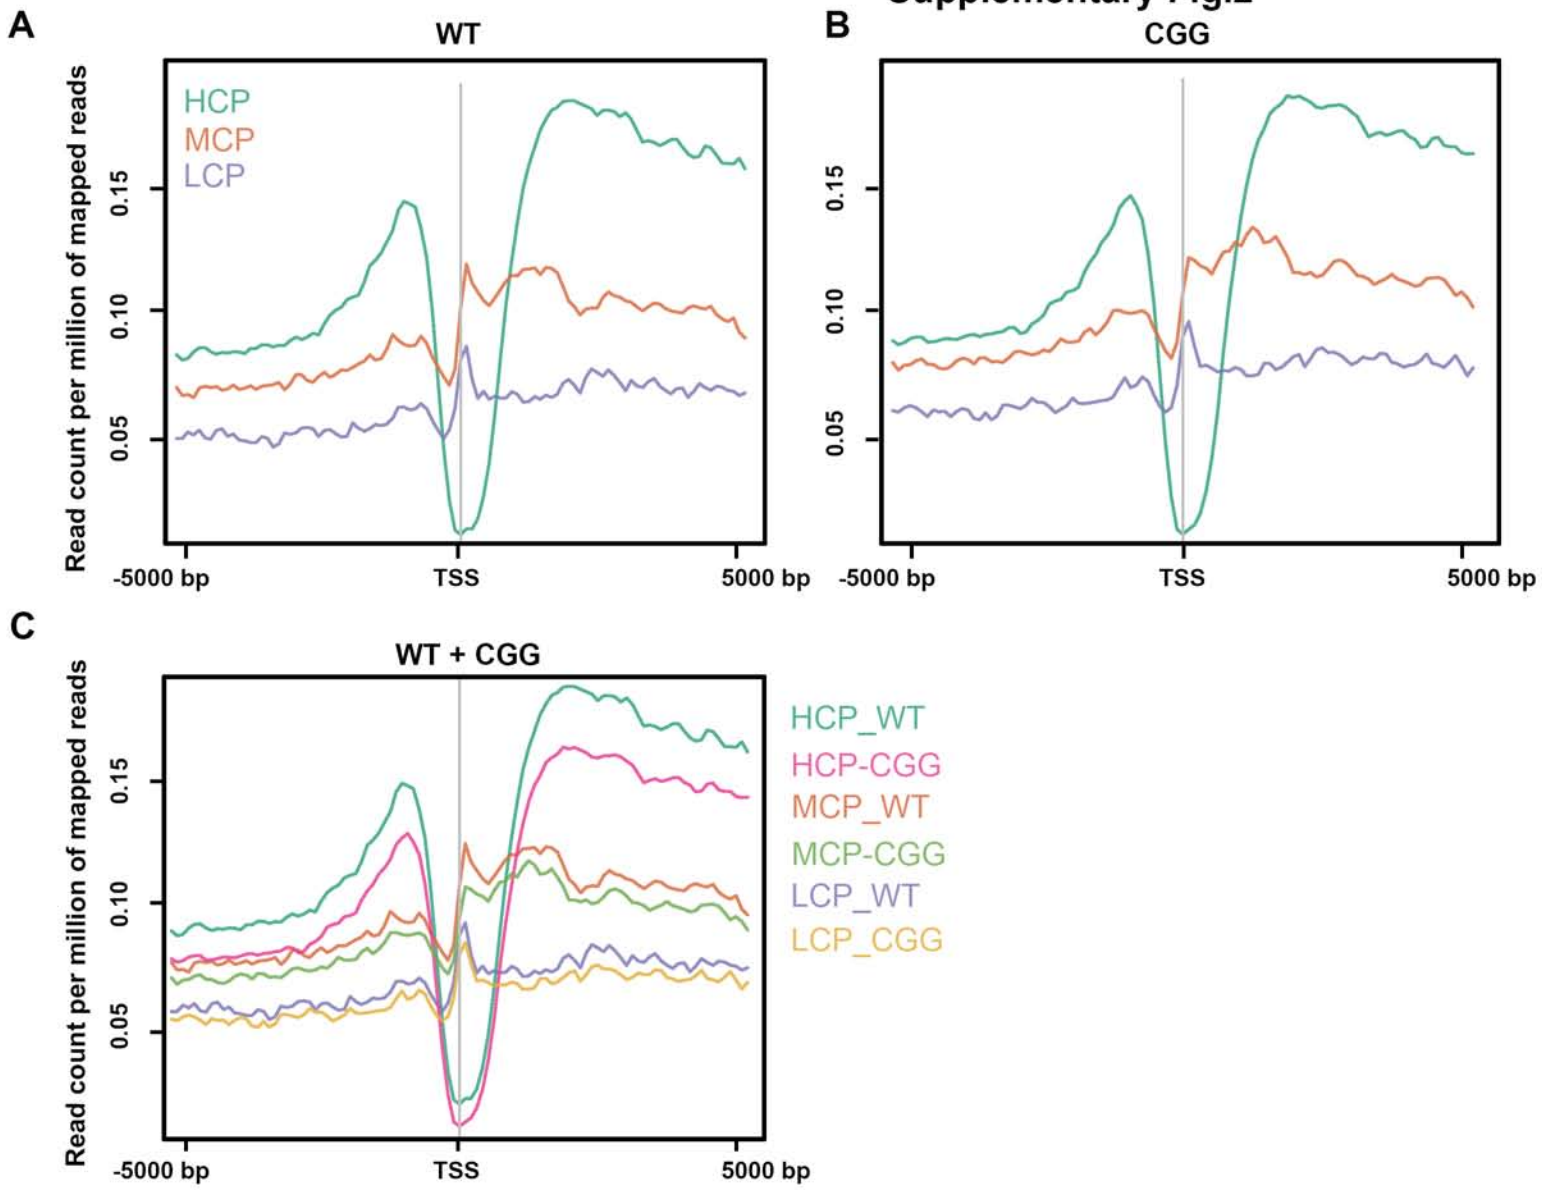

Supplementary Table 2-3. Wild-type- or rCGG-specific DhMRs identified by MACS.

Supplementary Table 4-5. Wild-type- or rCGG-specific DhMRs annotation results by HOMER.

Supplementary Fig.1

Supplementary Fig.2

A

Wildtype DhMRs GO analysis (8658 DhMR regions)

B

CGG DhMRs GO analysis (4311 DhMR regions)

Supplementary Table 1

replicates	Monoclonal reads	Number of peaks called to input	Number of negative peaks called (enrich in input)
16wkWT-1	6,568,046	80877	207
16wkWT-2	4,597,660	57118	140
16wkWT-3	9,194,192	90508	290
16wkCGG-1	13,429,874	114476	350
16wkCGG-2	12,328,423	114032	370
16wkCGG-3	8,309,064	76635	210

Combined samples	Monoclonal reads	Number of peaks called to input	DhMRs in WT or CGG
16wkWT	20,359,898	95116	8658
16wkCGG	46,744,882	77846	4311
