

Supplementary Information of “Using Single Cell Sequencing Data to Model the Evolutionary History of a Tumor”

Kyung In Kim and Richard Simon

November 11, 2013

1 Stability of mutation tree of the 18 sites

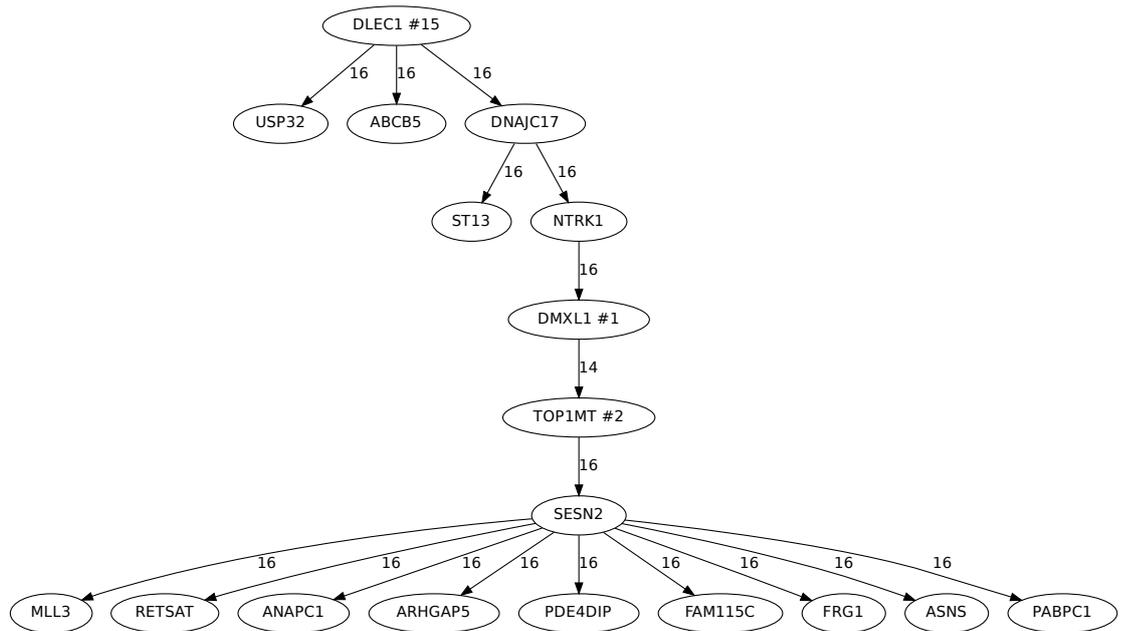

Figure S1: Summary of the site leave-one-out replication for the 18 sites. Each tree was based on 17 sites, one site omitted from the 18 sites sequentially. The frequencies of root site and branches of the site leave-one-out tree in the original tree are presented. For example, DLEC1 was found as root in 15 trees and DMXL1 was found as root in 1 trees and TOP1MT was found as root in 2 trees. Branches in the original tree were also found frequently in the 18 trees and the minimum frequency of branch in the original tree was 14.

2 Posterior probabilities of pairwise order relations for the 18 sites

Table S1: Posterior probabilities of pairwise order relations for the 18 sites.

3 Optimized time to the MRCA under varying population growth rate

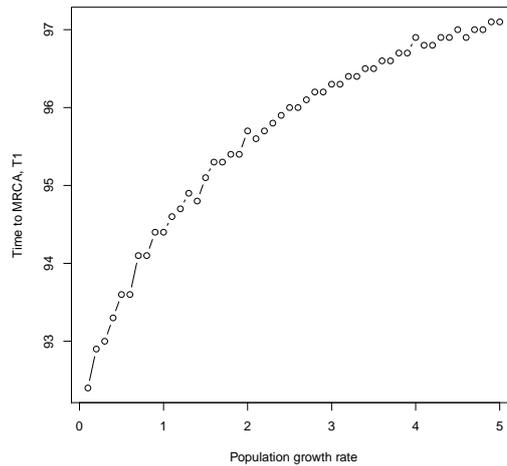

Figure S2: Optimization of the tuning parameter α under varying population growth rate. x -axis represents varying population growth rates and y -axis represents the optimized proportion of time to the MRCA over the total time, α . Population size is assumed to increase with a constant rate from the MRCA of the sample. Under the constant population size (population growth rate = 0), the optimized α is 0.92. The optimized α appears to increase as the fixed population growth rate increases.

4 Prior probabilities under varying population growth rate

Table S2: Prior probabilities, $\Pr(x \rightarrow y)$ and $\Pr(x \not\leftrightarrow y)$ for given population growth rate. $\Pr(x \leftarrow y)$ is same as $\Pr(x \rightarrow y)$.

population growth rate	$\Pr(x \rightarrow y)$	$\Pr(x \not\leftrightarrow y)$
