3 p-value¹ indicates the significance value for the comparison between exclude exons and
 4 included exons

5 p-value² indicates the significance value for the comparison between exon variants and non-
 6 regulated exons.

7 R1~R4 indicates the intronic region surrounding the exon variants. Schematic view of
 8 R1~R4 is illustrated in Fig. 2A.

9 ★, representative motifs displayed in Fig. 2B-2C.

1 **Supplementary Figure 1**

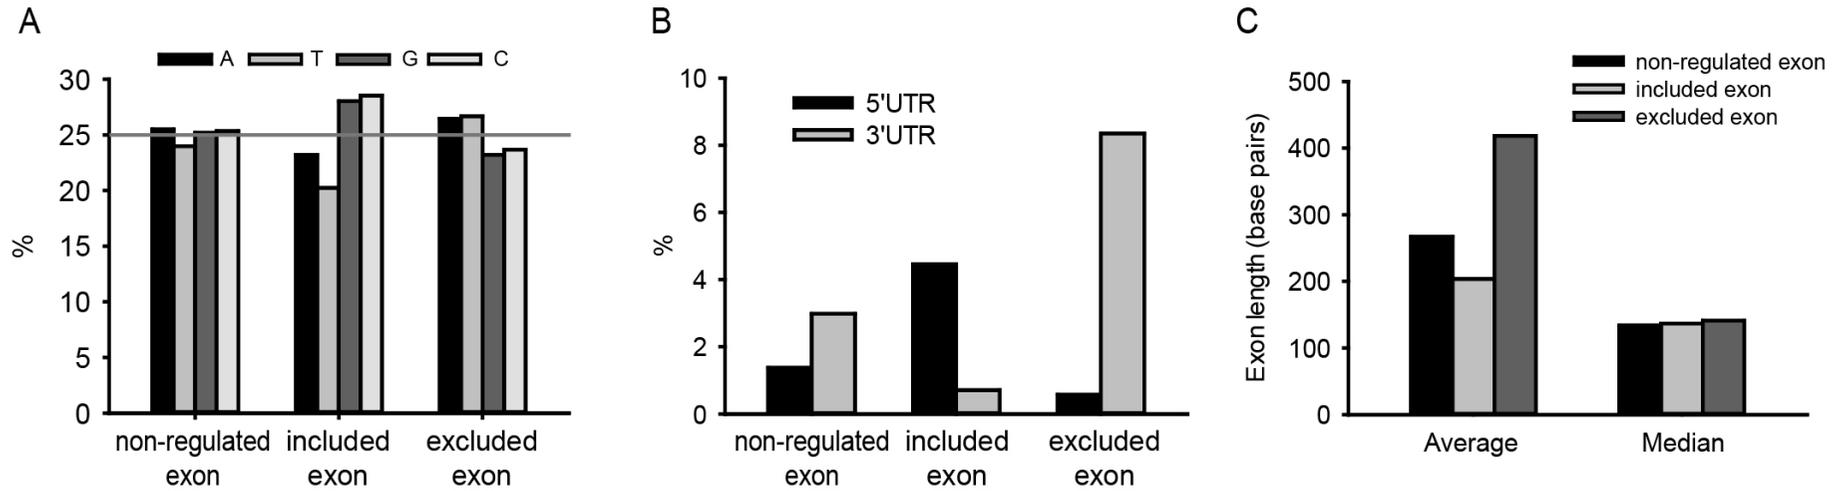

2

3 Supplementary Figure 1. Distribution of alternative splicing types of the exons excluded, included and non-regulated. Alternative
4 splicing types were analyzed based on UCSC 'knownAlt' track and ASTD (Alternative Splicing and Transcript Diversity Database)
5 information.

6

1 **Supplementary Figure 2**

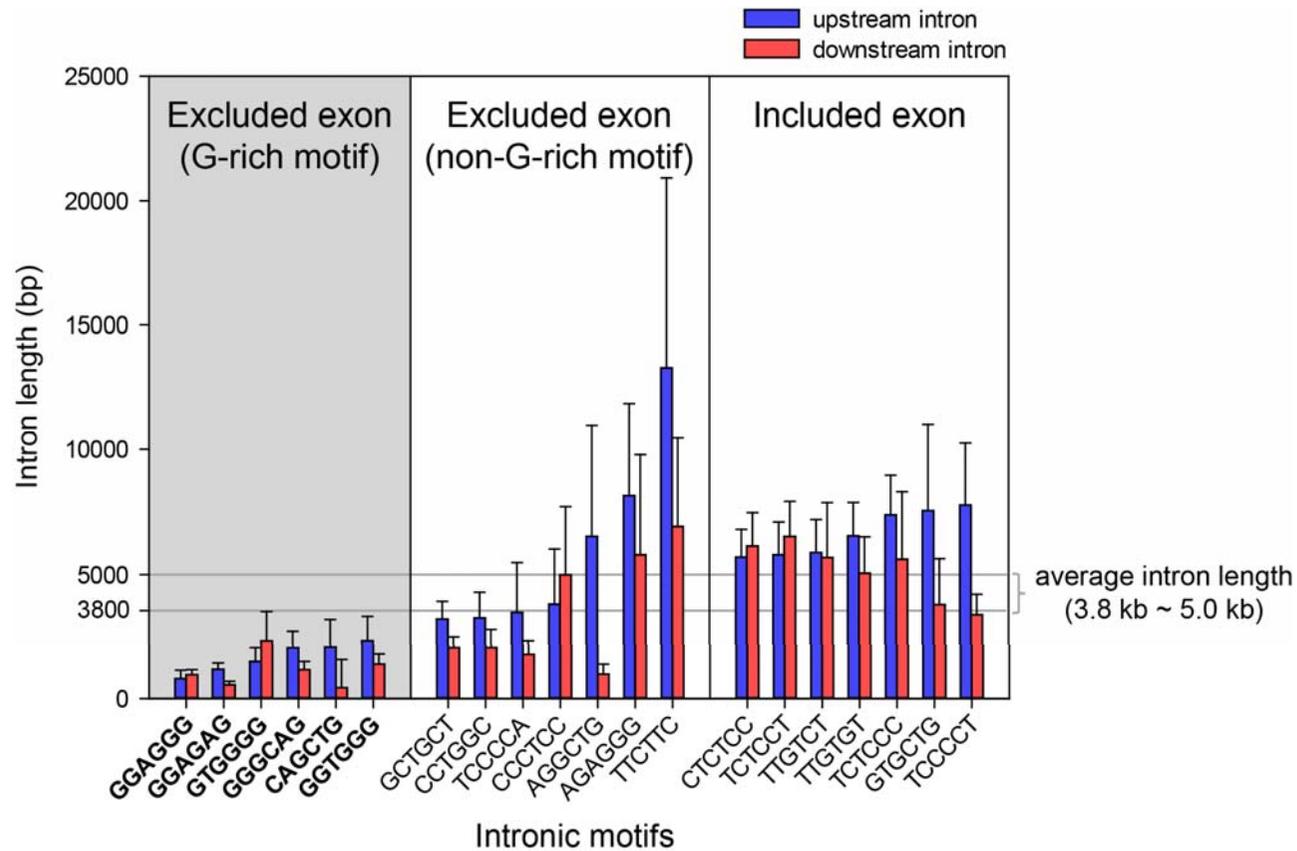

2

3 Supplementary Figure 2. The properties of exon variants and non-regulated exons. (A) Nucleotide composition of the exon
4 variants and non-regulated exons. (B) Percentage of 5' or 3'UTR in exon variants and non-regulated exons. (C) Average and
5 median length of exon variants and non-regulated exons.

6

1 **Supplementary Figure 3**

2

3 Supplementary Figure 3. Length of upstream and downstream introns of excluded/included exons containing the intronic motifs.
 4 Bars represent means \pm SEM. Lengths of the introns, which are flanking the excluded exon and contain the G-rich intronic motifs,
 5 are much shorter than the average intron length of mouse.
