Plasmid construction

All plasmids were constructed using standard recombinant DNA techniques and are listed in Table S2. Restriction enzymes and T4 DNA ligase were from New England BioLabs (Ipswich, MA, USA). DNA digestion and ligation were performed according to the recommendations of the manufacturer. PCR, unless otherwise noted, was performed according to standard protocols using Taq DNA Polymerase (New England BioLabs, Ipswich, MA, USA) or KOD Hot Start DNA Polymerase (Novagen, Madison, WI, USA). Mutagenic primers used in strain construction are listed in Table S3.

To incorporate mutant *sicP* and *sptP* alleles into the bacterial chromosome, R6K replication origin-based suicide vectors were designed to include approximately 1kb of homologous sequence both upstream and downstream of the mutated operon. For mutations upstream of *sptP-phoA*, Primers 5-dst-SptP-SpeI (5-aaACTAGTTATGACGACGGCAAGCTG) and 3-dst-SptP-SmaI (5-AAAAAAccgggGGCGATGAATTACGCTCAC) were used to amplify ~1kb downstream of *sptP* for cloning into the SpeI and SmaI restriction sites of pSB0890. A subsequent cloning step introduced the mutant allele plus ~1kb upstream of *sicP* into the SpeI and NotI sites of pSB890. Mutagenic primers (Table S3) were designed to introduce the desired nucleotide change(s) through a process called overlap extension PCR (Ho, Hunt et al. 1989). The flanking primers used were 5-ups-SicP-NotI (5-aaaaaaaaGCGGCCGcagagaggcgcccgt) and 3-PhoA-SpeI (5-AAactagtTTATTCAGCCCCAGAGCGG). For *lacZ* fusions, R6K vectors were constructed similarly, except the flanking primers used were 5-ups-SicP-NotI (5-aaaaaaaaGCGGCCGcagagaggcgcccgt) and 3-lacZ-SpeI (5-GATCactagtTTATTTGACACCAGACCAACTGG).

To incorporate mutations upstream of full-length *sptP*, appropriate mutagenic primers (Table S3) were used to introduce the desired mutations, and flanking primers 5-ups-SicP-BamHI (5-aaGGATCCagagaggcgcccgt) and 3-dst-SicP-NotI (5-aaaaaaaaGCGGCCGcggctacaccgacactg) were used for amplification. The resulting PCR product was digested and cloned into the BamHI and NotI sites of pSB0890.

To construct a triple-FLAG tagged allele of *sicP*, mutagenic primers 5-SicP-3xFLAG (5-GACGGTGATTATAAAGATCATGACATTGATTAC AAGGATGACGATGACAAG CAAGCACACCAGGATATTATCGC) and 3-SicP-3xFLAG (5-GTAATCAATGTCATGATCTTATAATCACCGTCATGGTCTTGTAGTCCAATTACTT TCCTCTTGAATTATATCTTTATAAG) were used to introduce the tag at codon 2 of *sicP*. Flanking primers 5-ups-SicP-BamHI (5-aaGGATCCagagaggcgcccgt) and 3-dst-SicP-NotI (5-aaaaaaaaGCGGCCGcggctacaccgacactg) were used for amplification. The resulting PCR product was digested and cloned into the BamHI and NotI sites of pSB0890.

To construct the R6K plasmid to introduce *sicPSTOP sptP-phoA sicP after* into the bacterial chromosome, triple-FLAG tagged *sicP* flanked by SpeI sites was amplified using primers 5-3xFSicP-SpeI (5-aaACTAGTgatataattcaagaggaaagtaaaTTGGAC) and 3-SicP-SpeI (5-AAactagtGCCTCATACTTAGCATATTCCCTGC).

To construct pSB4167 and pSB4168 (R6K suicide plasmids carrying *weak* or *strong RBS 3xF-sicP sptP-phoA*, respectively) two rounds of overlap extension PCR were required. The first replaced the native *sicP* RBS with either the “weak” or “strong” RBS using mutagenic primers described in Table S3 and flanking primers 5-ups-SicP-NotI (5-aaaaaaaaaCGGGCCG Cagagaggcgggctg) and 3-SptP-HindIII (5-agtaCAGCTTAGTATTTCTTAGCAATATAAAGTCGGG). The second round of overlap extension PCR used mutagenic primers described in Table S3 to fuse triple-FLAG tagged *sicP* preceded by mutant RBSs to *sptP-phoA*. The flanking primers used were 5-ups-SicP-NotI (5-aaaaaaaaaCGGGCCG Cagagaggcgggctg) and 3-PhoA-SpeI (5-AAactgtTTATTCAGCCCCAGAGCGG).

To construct pSB4169 (an R6K suicide plasmid carrying *sicP-FS sptP sicP after*), first, three DNA fragments were created for sequential cloning into pSKII (Stratagene, Heidelberg, Germany). First, ~1kb of sequence immediately downstream of *sptP* was amplified using primers 5-SptP-insEcoRI (5-TTATGACGACGGCAAGCTGAtaaaGAATTCAacatagcttacttttagaactatc) and 3-dst-SptP-NotI (5-aaaaaaaaaCGGGCCGCTAGGCGATGAATTACGCTCAC) and cloned into the vector. Then, to create frameshifted *sicP* upstream of full-length *sptP*, mutagenic primers (Table S3) were used with the flanking primers 5-ups-SicP-XhoI (5-aaCTCGAGagagaggcgggctg) and 3-SptP-insEcoRI (5-GATAGTTCTAAAAGCTATGTTGAATTCTTATCAGCTGCCGTCGTCTAA). The resulting fragment was digested and cloned into the pSKII vector. Finally, wild type *sicP* was amplified using primers 5-SicP-EcoRI (5-aaGAATTCAaatcttataaaagatataattcaagagggaaag) and 3-SicP-EcoRI (5-AAgattcGCCTCATACTTACGATATTCTG), digested, and cloned into the vector. Correct orientation of the open reading frame was verified by PCR, and the entire insert was amplified using primers 5-ups-SicP-NotI (5-aaaaaaaaaCGGGCCG Cagagaggcgggctg) and 3-dst-SptP-SmaI (5-AAAAAAAcccgggGGCGATGAATTACGCTCAC) and cloned into pSB0890.

Plasmid pSB2978, which expresses epitope-tagged SicP was constructed by excising a ~600 bp fragment encoding *SicP-m45* from plasmid pSB0680 (Fu and Galan) using restriction enzymes NheI and AccI. The fragment was cloned into pWSK129 (Wang and Kushner) digested with NheI and AccI.

Plasmids pSB4065, pSB4066, and pSB4067 were constructed by amplifying the desired allele using primers 5-SicP-NotI (5-aagaacaCGGGCCG Caattgaagaagcaatcttataaaagatataattc) and 3-PhoA-KpnI (5-AAgttaccTTATTCAGCCCCAGAGCGG). The resulting fragments were digested and cloned into pWSK29 (Wang and Kushner).

Inserts for plasmids pSB4154, pSB4155, and pSB4156 were constructed by overlap extension PCR using mutagenic primers to introduce the desired mutations upstream of *sptP-phoA* and flanking primers 5-SicP-NotI (5-aagaacaCGGGCCG Caattgaagaagcaatcttataaaagatataattc) and 3-PhoA-KpnI (5-AAgttaccTTATTCAGCCCCAGAGCGG). The resulting fragments were digested and cloned into pWSK29 (Wang and Kushner).

SB2418, 20	5-SptPPhoAmid	CCCGACTTATATTGCT AAGGAAAATACTAAC TTCGGACACCAGAAAT G	Creates a translational fusion of <i>sptP</i> to reporter gene <i>phoA</i> ; joins the first 27 codons of <i>sptP</i> to codon 45 of <i>phoA</i> . These primers also insert a HinDIII site (AAGCTT) at the juncture between <i>sptP</i> and <i>phoA</i>
