

Supplemental Figures

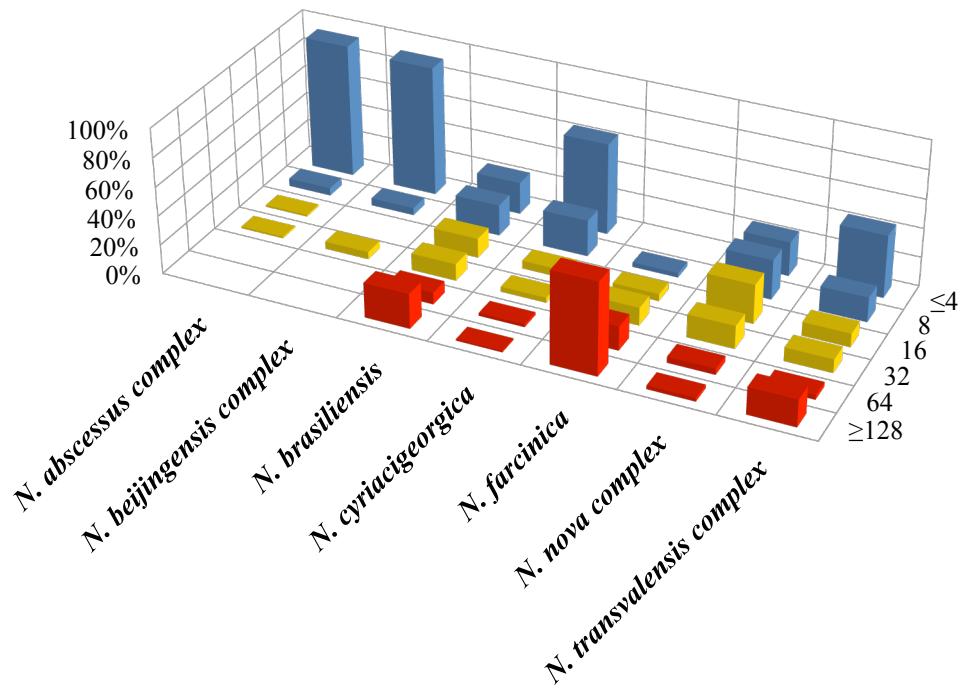

A - TMP-SXT

B - Imipenem

C - CTR

D - AMK

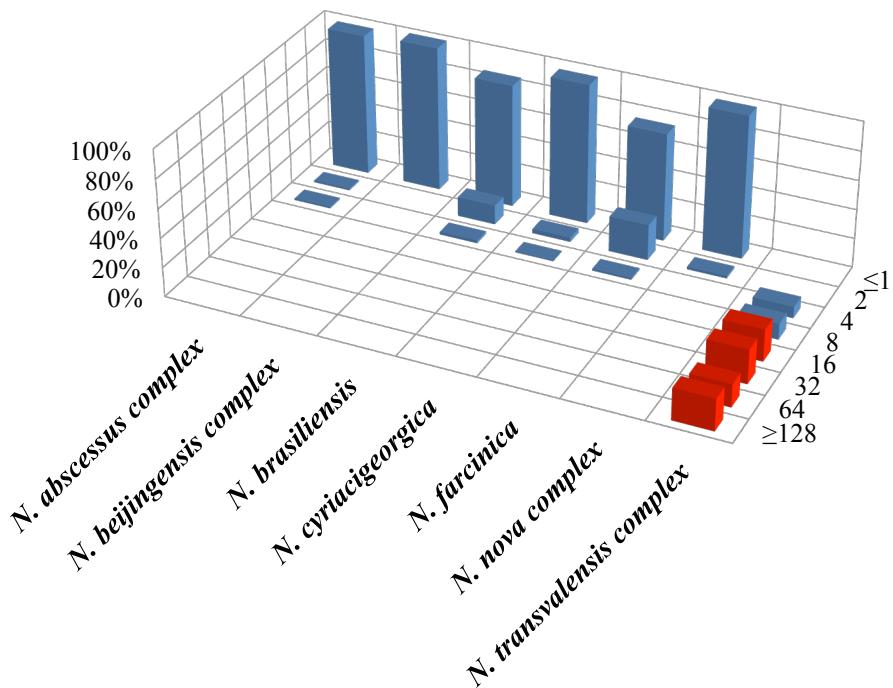

Figure S1. MIC distribution for the 7 most common *Nocardia* species.

TMP-SXT - trimethoprim-sulfamethoxazole, IMI - imipenem, CTR - ceftriaxone, AMK – amikacin. Open bars – susceptible, grey bars – intermediate, black bars - resistant

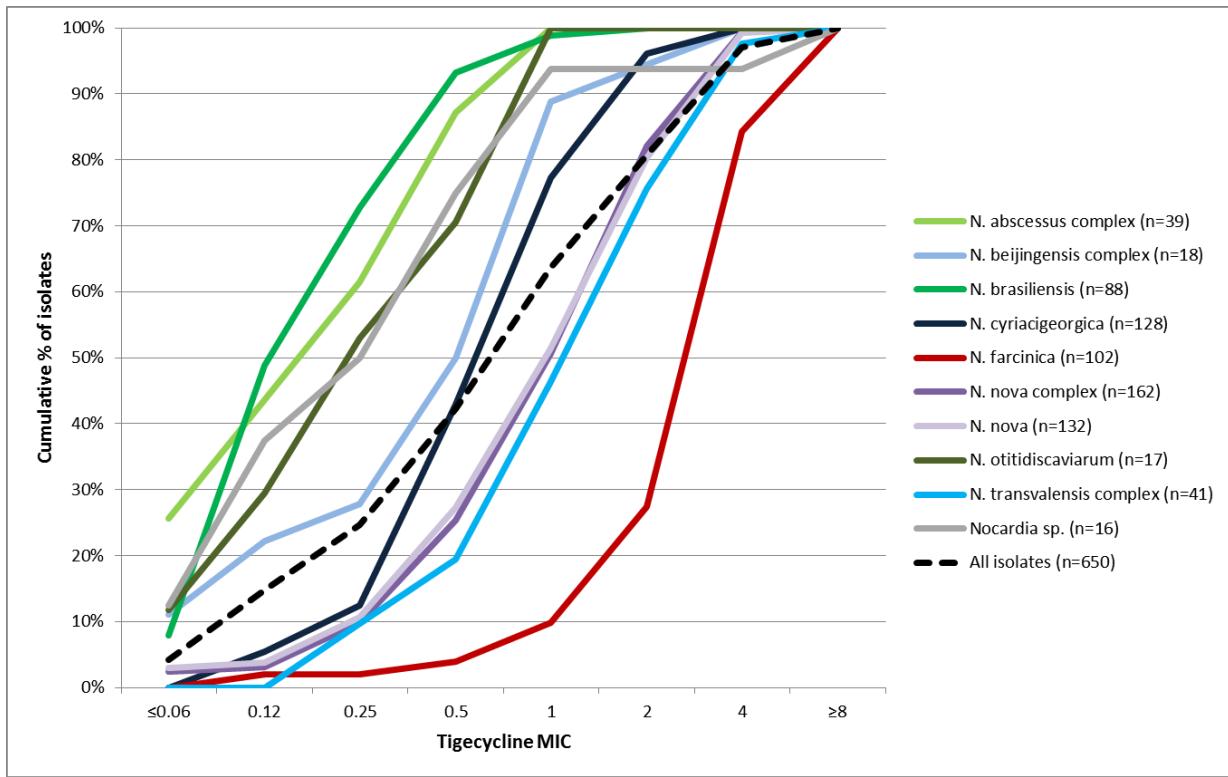

Figure S2. Cumulative proportion of isolates with a given tigecycline MIC for all species or complexes with greater than 10 isolates

Supplemental Table. Frequency distribution of Nocardia species identified by partial 16S sequencing during a 6-year period (2006-2011).

Abbreviations: AST – antimicrobial susceptibility testing; description – year that the species was validly described (1)

* Species belonging to this complex cannot be reliably distinguished by partial 16S sequencing

** Frequency distribution of the species *N. nova* is provided independently from the larger *N. nova* complex
