

FIG. S1. Comparative pro-inflammatory IFN γ (A) and TNF α (B) cytokine responses of human PBMC stimulated with bacterial reference strains and *S. salivarius* strains for 24h. Immunocompetent cells were stimulated by bacteria for 24h with a multiplicity level of infection of 10 and collected supernatants were analyzed by ELISA. Data are expressed in pg/ml as means and standard deviations of results for four distinct healthy blood donors.
