Supplementary Figure S2. Class-wise multiple sequence alignment of full length OYE proteins from fungi. The alignment was generated with the PROMALS3D program using default parameters and visualized by Jalview 2.8 (Supplementary reference 1). (A), (B) and (C) Class I OYEs, (D) (E) and (F) Class II OYEs, and (G) and (H) Class III OYEs. The positions of the conserved active site residues and other class specific conserved motifs as described in text are highlighted with the rectangular boxes. The consensus sequence is displayed below the alignment.

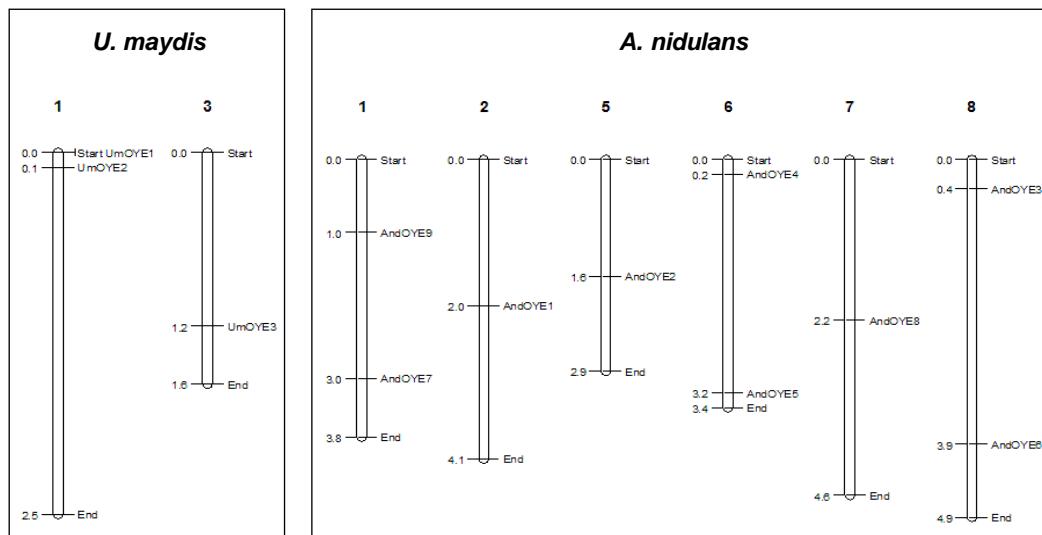

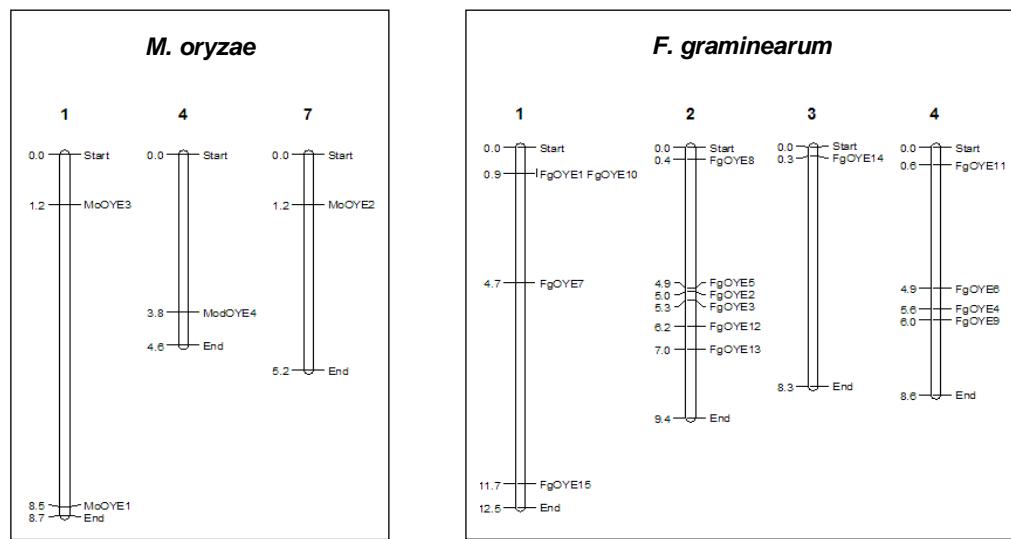

Supplementary Figure S3. Location of conserved motifs in the structures of typical OYEs. 3D structures of (A) yeast OYE1 (PDBID: 1OYB) representing Class I OYE and (B) YqjM (PDBID: 1Z42) representing Class II OYE were retrieved from the Protein Data Bank (PDB) and visualized using PyMOL (www.pymol.org). The cartoon representation shows the backbone of both proteins, whereas conserved amino acid residues along with the cofactor (FMN) are shown as sticks. (C) Table shows the location of these conserved motifs in the loop region of their respective 3D structures. (D) Superposition of the two structures (OYE1 = smudge green and YqjM = sky blue) with their respective conserved motifs.

Supplementary Figure S4. Comparison of OYEs among fungi, (A) between ascomycetes (black) and basidiomycetes (red), and (B) among different classes of ascomycetes.

Supplementary Figure S5. Chromosomal distribution of OYE genes in few selected fungi. Physical locations of OYEs are represented on the respective chromosomes in eight different fungal species. On the top of each chromosome, the chromosome number is written. Values on the left side of the chromosome represent the position of the corresponding gene on the right side. Chromosomal distances are in Mb.
