Abstract

Introduction: Immunisation coverage data in low-income and middle-income countries (LMICs) suggests more strategies need to be implemented to achieve and sustain optimal vaccine uptake. Among possible strategies to improve immunisation coverage, are supplementary immunisation activities (SIAs). We are therefore interested in conducting a systematic review to assess whether SIAs complement routine immunisation programmes to improve vaccination coverage and prevent disease outbreaks.

Methods: Our systematic review will focus on studies conducted in LMICs. With the help of an information specialist, we will search for eligible studies in PubMed, Web of Science, Scopus, Africa-Wide, Cochrane Library, WHOLIS, CINAHL, PDQ-Evidence as well as reference lists of relevant publications. Additionally, we will contact relevant organizations such as WHO and GAVI. We will screen search outputs, select studies and extract data in duplicate; resolving discrepancies by discussion and consensus.

Discussion: The findings from this systematic review will be discussed in the context of strengthening routine childhood immunisation services, routine adolescent immunisation services, and introduction of future vaccines against tuberculosis and HIV/AIDS.

Background

Infectious diseases are prevalent in low-income and middle-income countries (LMICs). For example, tuberculosis (TB) is a pandemic of great public health concern. In 2011, the World Health Organization (WHO) estimated that 1.4 million people died worldwide from TB [1]. To control the TB pandemic, stakeholders have proposed multipronged approaches; including development of new and more effective vaccines, novel and better drug regimens, faster and more accurate diagnostic tools as well as strengthening of public health systems. Among these approaches, more effective TB vaccines are likely to have the greatest impact [2]. Research and development of new and better TB vaccines has been accelerated. There were twelve new TB vaccines candidates in human clinical trials in the year 2012 [3, 4]. For the effective TB vaccines to achieve the desired impact, vaccination coverage must be optimal.

Uptake of vaccines delivered through routine immunisation programmes remains variable, and often poor in many LMICs [5, 6], suggesting that routine immunisation services alone are insufficient to achieve optimal immunisation coverage in LMICs. Taking into account that TB burden is highest in LMICs [7], it is likely that future effective TB vaccines will not reach desirable vaccination coverage in these settings if delivered only through the routine immunisation services. Therefore, additional strategies will need to be adopted to improve immunisation coverage, including supplementary immunisation activities (SIAs)[8, 9]

1
2
3
4
5
6 SIAs have been successfully used in different disease conditions, including
7
8 typhoid , measles [10-12], polio [13], human papillomavirus [14] and cholera [15].
9
10 The major reported benefits of SIAs are increased immunisation coverage,
11
12 reduced disease spread and cost-effectiveness [16]. Abu-Raddad *et al* have
13
14 used a mathematical model to show a significant additive public health benefit in
15
16 the reduction of TB incidence by incorporating SIAs to other key interventions of
17
18 neonatal vaccination and better TB treatment and diagnostic tools [2].
19
20
21
22
23

24
25 However, the use of SIAs to improve immunisation coverage and prevents
26
27 disease outbreaks in LMICs relative to routine immunisation services remain
28
29 controversial [8, 17]. To utilise SIAs successfully in the control of TB with future
30
31 effective vaccines, it is worthwhile to synthesize the current best evidence on the
32
33 effectiveness of this strategy. A study conducted in South Africa, a middle-
34
35 income country with a high burden of TB, showed that TB incidence peaks in
36
37 adolescence and adolescents are the greatest force of *Mycobacterium*
38
39 *tuberculosis* (*M.tb*) infection within a population [18]. This study suggests that a
40
41 new effective TB vaccine would have the greatest impact in the control of TB
42
43 when targeted to the adolescent population. We propose to conduct a systematic
44
45 review to assess whether, at present, there exists evidence that SIAs improve
46
47 immunisation coverage and reduce disease burden in LMICs.
48
49
50
51
52
53
54

55 To the best of our knowledge, the most recent comprehensive systematic review
56
57
58
59
60

1
2
3 on SIAs was conducted by Dietz and Cutts in 1997 and involved studies
4 published up to 1992 [16]. Since then, there have been many changes, among
5 them, population increase [19], change in disease epidemiology [20], emergence
6 of anti-vaccine groups [21] as well as expanded healthcare infrastructure. These
7 changes may negatively affect the performance of immunisation services in
8 obtaining optimal vaccination coverage. Furthermore, new vaccines continue to
9 be incorporated to the existing Expanded Programme on Immunisation (EPI) [22,
10 23], adding more logistical and financial pressure to the routine immunisation
11 services.

17
18
19
20
21
22
23
24
25
26

27 In the context of these changes that may affect the vaccination coverage, it is
28 rational to hypothesize that at present, the effects of SIAs in complementing
29 routine immunisation services may be different from those reported in the past by
30 Dietz and Cutts in 1997. In support of this hypothesis, some authors reported that
31 SIAs negatively affect the routine immunisation services [24, 25] whereas some
32 studies, report the opposite: SIAs increase immunisation coverage and reduce
33 disease outbreaks [26-29]. Therefore, an up to date systematic review is critical
34 to provide evidence on the relevance of SIAs in the current health systems
35 environment. This evidence will be useful, particularly for LMICs because these
36 settings are the epicentre of vaccine-preventable diseases and (by definition)
37 have limited resources.

Objectives

- 1) To determine whether SIAs increase vaccination coverage and reduce disease outbreaks in LMICs
- 2) To describe the lessons learnt during SIAs and how these may guide the introduction of future vaccines (TB, HIV, malaria) in LMICs.

Methods

Types of studies:

We will consider primary studies with the following designs:

- Intervention studies: individually randomised controlled trials (RCTs), cluster-randomised controlled trials (cRCT), non-randomised control trials, interrupted time series (ITS), and controlled before-and-after studies (CBAs)
- Observational studies: cohort studies, case-control studies, and cross-sectional studies.

Review articles will be excluded.

Study settings

Studies conducted in LMICs as defined by the World Bank GDP ranking in July 2013.

Types of interventions

This study will focus on SIAs, also referred to as mass vaccination campaigns. SIAs are defined as immunisation activities whereby a vaccine is taken simultaneously to many residents of a community within a defined short space of time. We will exclude studies of routine immunisation services, that is, immunisation services rendered (at fixed, outreach or mobile sites) regularly throughout the year. In addition, mass campaigns conducted for other purposes other than immunisation, for example, mass information campaigns to educate communities about general health issues will not be included.

Types of outcome measures

Primary outcomes:

- Vaccination coverage achieved during SIAs
- Disease outbreaks
- Disease incidence

Secondary outcomes:

- Routine immunisation coverage

Search methods for identification of studies

A comprehensive search strategy will be developed, including various terms relating to SIAs and LIMCs, for identification of both published and unpublished articles with no language restriction. We will search academic peer-reviewed journals, grey literature (non-published or non-reviewed papers, reports), and

1
2
3 reference lists of relevant publications. The detailed electronic search strategy is
4 provided in appendix 1 while the summary of the search outputs retrieved from
5 different databases is in appendix 2.
6
7
8
9

10 11 12 **Electronic searches**

13 We will search the following electronic databases for primary studies

- 14 • Pubmed
 - 15 • Web of Science
 - 16 • Cochrane Central Register of Controlled trials (CENTRAL)
 - 17 • Scopus
 - 18 • Africa Wide
 - 19 • PDQ-Evidence
 - 20 • WHOLIS
 - 21 • CINAHL
- 22

32
33
34
35
36
37
38

39 **Data collection and analysis**

40 **Selection of studies**

41 Two authors will independently screen the search outputs for potentially eligible
42 studies, compare their results, and resolve disagreements by discussion and
43 consensus. The two authors will then independently go through the full text of all
44 potentially eligible studies to assess whether the studies meet the inclusion
45 criteria defined by the study design, setting, intervention and outcomes.
46
47
48
49

55
56
57
58
59
60

1
2
3 Discrepancies in the list of eligible studies between the two authors will be
4
5 resolved through discussion and consensus.
6
7
8
9

10 11 12 **Data extraction**

13
14 A structured and standardised data collection form has been developed for
15
16 extracting data from the selected studies. The form will capture key study
17
18 characteristics, including methods, participants and outcomes (appendix 3). Prior
19
20 to use, the extraction form will be piloted on at least four included studies
21
22 identified randomly from the list of included studies.
23
24
25
26
27
28

29 30 **Assessment of risk of bias in included studies**

31
32 The quality of studies will be assessed using the Cochrane Collaboration's tool
33
34 for assessing risk of bias [30] for experimental studies and the SIGN checklist for
35
36 other study designs [31].
37
38
39
40
41

42 43 **Measures of treatment effect**

44
45 We will express the result of each study as a risk ratio with its corresponding
46
47 95% confidence intervals for dichotomous data, or mean difference with its
48
49 standard deviation for continuous data. We will conduct meta-analysis for the
50
51 same type of participants, interventions, study designs, and outcome measures
52
53 where homogeneity of data allows. Heterogeneity will be assessed using the chi-
54
55 squared test of homogeneity, and quantified using the I-squared statistic [32, 33].
56
57
58
59
60

Dealing with missing data

For the recently (2010 onwards) published literature, if any selected study has incomplete or missing data, we will contact the authors for more information. If the authors provide no additional information, a decision will be taken by at least two authors on the inclusion of the study in the final analyses.

Assessment of heterogeneity

We anticipate substantial variation in study results due to differences in the study design, co-interventions, study settings (low-income versus lower-middle-income versus upper-middle-income countries), and risk of bias. We will examine statistical heterogeneity between study results using the Chi-squared test of homogeneity (with significance defined at the alpha-level of 10%), and quantify any statistical heterogeneity between study results using the I-squared statistic [30].

Assessment of reporting biases

A funnel plot will be used to investigate the risk of publication bias by intervention type, provided 10 or more studies are included in the analysis for each intervention type [34, 35]. The funnel plot will be critically examined for asymmetry.

Sensitivity analysis

1
2
3 We will conduct sensitivity analysis to establish if the meta-analysis results are
4 influenced by: the effect of study designs; publication type (peer-reviewed versus
5 grey literature) the geographical settings (low-income versus lower-middle-
6 income versus upper-middle-income countries); and study period (published
7 before 2000 versus published after 2000).
8
9
10
11
12
13
14
15
16

17 **Discussion**

18
19 This systematic review will establish whether SIAs improves immunisation
20 coverage, prevent disease outbreaks, and have negative impact on routine
21 immunisation services in LMICs. The review will provide an up-to-date evidence
22 base of the benefits and harms of the use of SIAs in the control of vaccine-
23 preventable disease. Additionally, we will discuss how the findings of this review
24 may be applicable in the context of future vaccines against TB, HIV and malaria.

Contributoship Statement

BMK, CSW, SM and GDH conceived the study.

BMK, SM, LHA and EA wrote the protocol with supervision from CSH and GDH
OAU wrote the statistical analysis plan for the study and provided comments to the manuscript.

GDH sourced the funds for the study.

Funding

This work was supported by the Aeras Global TB Foundation

Abstract

Introduction: Immunisation coverage data in low-income and middle-income countries (LMICs) suggests more strategies need to be implemented to achieve and sustain optimal vaccine uptake. Among possible strategies to improve immunisation coverage, are supplementary immunisation activities (SIAs). We are therefore interested in conducting a systematic review to assess whether SIAs complement routine immunisation programmes to improve vaccination coverage and prevent disease outbreaks.

Methods: Our systematic review will focus on studies conducted in LMICs. With the help of an information specialist, we will search for eligible studies in PubMed, Web of Science, Scopus, Africa-Wide, Cochrane Library, WHOLIS, CINAHL, PDQ-Evidence as well as reference lists of relevant publications. Additionally, we will contact relevant organizations such as WHO and GAVI. Two authors will independently extract data from eligible studies and independently assess risk of bias by assessing the adequacy of study characteristics. The primary meta-analysis will use random effects models due to expected inter-studies heterogeneity. Dichotomous data will be analysed using relative risk and continuous data using weighted mean differences (or standardised mean differences), both with 95% confidence intervals.

Discussion: The findings from this systematic review will be discussed in the context of strengthening routine childhood immunisation services, routine adolescent immunisation services, and introduction of future vaccines against tuberculosis and HIV/AIDS.

1
2
3 **Study strengths:** unbiased selection of many studies conducted in different
4 settings. This will strengthen the validity of the review results.
5
6

7
8 **Study limitations:** heterogeneity of the study settings of the low-income, lower-
9 middle income and upper-middle income countries as well as heterogeneity in
10 study designs.

Background

Infectious diseases are prevalent in low-income and middle-income countries (LMICs). For example, tuberculosis (TB) is a pandemic of great public health concern. In 2011, the World Health Organization (WHO) estimated that 1.4 million people died worldwide from TB [1]. To control the TB pandemic, stakeholders have proposed multipronged approaches; including development of new and more effective vaccines, novel and better drug regimens, faster and more accurate diagnostic tools as well as strengthening of public health systems. Among these approaches, more effective TB vaccines are likely to have the greatest impact [2]. Research and development of new and better TB vaccines has been accelerated. There were twelve new TB vaccines candidates in human clinical trials in the year 2012 [3, 4]. For the effective TB vaccines to achieve the desired impact, vaccination coverage must be optimal.

Uptake of vaccines delivered through routine immunisation programmes remains variable, and often poor in many LMICs [5, 6], suggesting that routine immunisation services alone are insufficient to achieve optimal immunisation coverage in LMICs. Taking into account that TB burden is highest in LMICs [7], it is likely that future effective TB vaccines will not reach desirable vaccination coverage in these settings if delivered only through the routine immunisation services. Therefore, additional strategies will need to be adopted to improve immunisation coverage, including supplementary immunisation activities (SIAs)[8, 9]

1
2
3
4
5
6 SIAs have been successfully used in different disease conditions, including
7
8 typhoid , measles [10-12], polio [13], human papillomavirus [14] and cholera [15].
9
10 The major reported benefits of SIAs are increased immunisation coverage,
11
12 reduced disease spread and cost-effectiveness [16]. Abu-Raddad *et al* have
13
14 used a mathematical model to show a significant additive public health benefit in
15
16 the reduction of TB incidence by incorporating SIAs to other key interventions of
17
18 neonatal vaccination and better TB treatment and diagnostic tools [2].
19
20
21
22
23

24
25 However, the use of SIAs to improve immunisation coverage and prevents
26
27 disease outbreaks in LMICs relative to routine immunisation services remain
28
29 controversial [8, 17]. To utilise SIAs successfully in the control of TB with future
30
31 effective vaccines, it is worthwhile to synthesize the current best evidence on the
32
33 effectiveness of this strategy. A study conducted in South Africa, a middle-
34
35 income country with a high burden of TB, showed that TB incidence peaks in
36
37 adolescence and adolescents are the greatest force of *Mycobacterium*
38
39 *tuberculosis* (*M.tb*) infection within a population [18]. This study suggests that a
40
41 new effective TB vaccine would have the greatest impact in the control of TB
42
43 when targeted to the adolescent population. We propose to conduct a systematic
44
45 review to assess whether, at present, there exists evidence that SIAs improve
46
47 immunisation coverage and reduce disease burden in LMICs.
48
49
50
51
52
53
54

55 To the best of our knowledge, the most recent comprehensive systematic review
56
57
58
59
60

1
2
3 on SIAs was conducted by Dietz and Cutts in 1997 and involved studies
4 published up to 1992 [16]. Since then, there have been many changes, among
5 them, population increase [19], change in disease epidemiology [20], emergence
6 of anti-vaccine groups [21] as well as expanded healthcare infrastructure. These
7 changes may negatively affect the performance of immunisation services in
8 obtaining optimal vaccination coverage. Furthermore, new vaccines continue to
9 be incorporated to the existing Expanded Programme on Immunisation (EPI) [22,
10 23], adding more logistical and financial pressure to the routine immunisation
11 services.
12
13
14
15
16
17
18
19
20
21
22
23

24
25
26
27 In the context of these changes that may affect the vaccination coverage, it is
28 rational to hypothesize that at present, the effects of SIAs in complementing
29 routine immunisation services may be different from those reported in the past by
30 Dietz and Cutts in 1997. In support of this hypothesis, some authors reported that
31 SIAs negatively affect the routine immunisation services [24, 25] whereas some
32 studies, report the opposite: SIAs increase immunisation coverage and reduce
33 disease outbreaks [26-29]. Therefore, an up to date systematic review is critical
34 to provide evidence on the relevance of SIAs in the current health systems
35 environment. This evidence will be useful, particularly for LMICs because these
36 settings are the epicentre of vaccine-preventable diseases and (by definition)
37 have limited resources.

Objectives

- 1) To determine whether SIAs increase vaccination coverage and reduce disease outbreaks in LMICs
- 2) To describe the lessons learnt during SIAs and how these may guide the introduction of future vaccines (TB, HIV, malaria) in LMICs.

Methods

Types of studies:

We will consider primary studies with the following designs:

- Intervention studies: individually randomised controlled trials (RCTs), cluster-randomised controlled trials (cRCT), non-randomised control trials, interrupted time series (ITS), and controlled before-and-after studies (CBAs)
- Observational studies: cohort studies, case-control studies, and cross-sectional studies.

Review articles will be excluded.

Study settings

Studies conducted in LMICs as defined by the World Bank GDP ranking in July 2013.

Types of interventions

This study will focus on SIAs, also referred to as mass vaccination campaigns. SIAs are defined as immunisation activities whereby a vaccine is taken simultaneously to many residents of a community within a defined short space of time. We will exclude studies of routine immunisation services, that is, immunisation services rendered (at fixed, outreach or mobile sites) regularly throughout the year. In addition, mass campaigns conducted for other purposes other than immunisation, for example, mass information campaigns to educate communities about general health issues will not be included.

Types of outcome measures

Primary outcomes:

- Vaccination coverage achieved during SIAs
- Disease outbreaks
- Disease incidence

Secondary outcomes:

- Immunisation coverage

Search methods for identification of studies

A comprehensive search strategy will be developed, including various terms relating to SIAs and LIMCs, for identification of both published and unpublished articles with no language restriction. We will search academic peer-reviewed journals, grey literature (non-published or non-reviewed papers, reports), and

1
2
3 reference lists of relevant publications. The detailed electronic search strategy is
4 provided in appendix 1 while the summary of the search outputs retrieved from
5 different databases is in appendix 2.
6
7
8
9

10 11 12 **Electronic searches**

13
14 We will search the following electronic databases for primary studies: Pubmed,
15 Web of Science, Cochrane Central Register of Controlled trials (CENTRAL),
16 Scopus, Africa Wide, PDQ-Evidence, WHOLIS and CINAHL.
17
18
19
20
21

22 23 24 **Data collection and analysis**

25 26 **Selection of studies**

27
28 Two authors will independently screen the search outputs for potentially eligible
29 studies, compare their results, and resolve disagreements by discussion and
30 consensus. The two authors will then independently go through the full text of all
31 potentially eligible studies to assess whether the studies meet the inclusion
32 criteria defined by the study design, setting, intervention and outcomes.
33 Discrepancies in the list of eligible studies between the two authors will be
34 resolved through discussion and consensus.
35
36
37
38
39
40
41
42
43
44
45
46
47

48 49 **Data extraction**

50
51 A structured and standardised data collection form has been developed for
52 extracting data from the selected studies. The form will capture key study
53 characteristics, including methods, participants and outcomes (appendix 3). Prior
54
55
56
57
58
59
60

1
2
3 to use, the extraction form will be piloted on at least four included studies
4
5 identified randomly from the list of included studies.
6
7
8
9

10 **Assessment of risk of bias in included studies**

11
12 The quality of studies will be assessed using the Cochrane Collaboration's tool
13 for assessing risk of bias [30] for experimental studies and the Scottish
14 Intercollegiate Guidelines Network (SIGN) checklist for other study designs [31].
15
16
17
18
19

20 **Measures of treatment effect**

21
22 We will express the result of each study as a risk ratio with its corresponding
23 95% confidence intervals for dichotomous data, or mean difference with its
24 standard deviation for continuous data. We will conduct meta-analysis for the
25 same type of participants, interventions, study designs, and outcome measures
26 where homogeneity of data allows. Heterogeneity will be assessed using the chi-
27 squared test of homogeneity, and quantified using the I-squared statistic [32, 33].
28
29
30
31
32
33
34
35
36
37
38
39

40 **Dealing with missing data**

41
42 The data will be analysed on an intention-to-treat basis as far as possible and
43 attempts will be made to obtain missing data from the original corresponding
44 author. Where missing data is unobtainable, imputation of individual values will
45 be undertaken for the primary outcomes only. For other outcomes, only the
46 available data will be analysed. Any imputation undertaken will be subjected to
47 sensitivity analysis. If studies report sufficient detail to calculate mean differences
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 but no information on associated standard deviation (SD), the outcome will be
4
5 assumed to have standard deviation equal to the highest SD from other studies
6
7 within the same analysis.
8
9

10 11 12 **Data synthesis**

13
14 All eligible studies will be summarised and analysed using Stata version 12 for
15
16 Windows. Two authors will extract the data, the first author will enter all data and
17
18 second author recheck all entries. Disagreements will be resolved by discussion.
19
20 If the studies are sufficiently similar, we will combine the data using random-
21
22 effects model due to anticipated heterogeneity that may result from the difference
23
24 in methodology and study settings. Where the rating scales used in the studies
25
26 have a reasonably large number of categories (more than 10) the data will be
27
28 treated as continuous variables arising from a normal distribution. We will use
29
30 weighted mean difference (WMD) when the pooled studies use the same rating
31
32 scale or test, and the standardised mean difference (SMD), the absolute mean
33
34 difference divided by the standard deviation when the studies use different rating
35
36 scales or tests. When the rating scales used are fewer than 10 and more than
37
38 two, we will concatenate the data into two categories that best represent the
39
40 contrasting states of interest, and treat the outcome measure as binary. Study
41
42 results for dichotomous data will be expressed as relative risk (RR) and 95%
43
44 confidence interval (CI). Time-to-event outcomes or generic inverse variance
45
46 outcomes, such as survival time and time to cure will be expressed as the log
47
48 hazards ratio and 95% CI.

1
2
3 When studies cannot be combined for meta-analysis due to diversity of
4 interventions, narrative syntheses will be conducted and results of individual
5 studies will be displayed graphically to enable more succinct summary of
6 evidence.
7
8
9
10
11
12

13 14 15 **Unit of analysis**

16
17 All cluster randomised trials that meet the inclusion criteria will be included in the
18 meta-analysis after adjusting for design effect using variation inflation method
19 [34, 35]: design effect = $1 + (M - 1)ICC$, where M is the average cluster size and
20 ICC is the intra-cluster correlation coefficient. If the authors did not report the
21 ICC, we will use ICC from a similar published trial. For estimated values of ICC,
22 we will conduct sensitivity analyses using larger and smaller ICCs to determine if
23 the results are robust.
24
25

27
28
29
30
31
32
33
34
35
36

37 **Assessment of heterogeneity**

38 We anticipate substantial variation in study results due to differences in the study
39 design, co-interventions, study settings (low-income versus lower-middle-income
40 versus upper-middle-income countries), and risk of bias. We will examine
41 statistical heterogeneity between study results using the Chi-squared test of
42 homogeneity (with significance defined at the alpha-level of 10%), and quantify
43 any statistical heterogeneity between study results using the I-squared statistic
44 [30].

Assessment of reporting biases

A funnel plot will be used to investigate the risk of publication bias by intervention type, provided 10 or more studies are included in the analysis for each intervention type [36, 37]. The funnel plot will be critically examined for asymmetry.

Sensitivity analysis

We will conduct sensitivity analysis to establish if the meta-analysis results are influenced by: the effect of study designs; publication type (peer-reviewed versus grey literature) the geographical settings (low-income versus lower-middle-income versus upper-middle-income countries); and study period (published before 2000 versus published after 2000).

Discussion

This systematic review will establish whether SIAs improves immunisation coverage, prevent disease outbreaks, and have negative impact on routine immunisation services in LMICs. The review will provide an up-to-date evidence base of the benefits and harms of the use of SIAs in the control of vaccine-preventable disease. Additionally, we will discuss how the findings of this review may be applicable in the context of future vaccines against TB, HIV and malaria.

Abstract

Introduction: Immunisation coverage data in low-income and middle-income countries (LMICs) suggests more strategies need to be implemented to achieve and sustain optimal vaccine uptake. Among possible strategies to improve immunisation coverage, are supplementary immunisation activities (SIAs). We are therefore interested in conducting a systematic review to assess whether SIAs complement routine immunisation programmes to improve vaccination coverage and prevent disease outbreaks.

Methods: Our systematic review will focus on studies conducted in LMICs. With the help of an information specialist, we will search for eligible studies in PubMed, Web of Science, Scopus, Africa-Wide, Cochrane Library, WHOLIS, CINAHL, PDQ-Evidence as well as reference lists of relevant publications. Additionally, we will contact relevant organizations such as WHO and GAVI. **Two authors will independently extract data from eligible studies and independently assess risk of bias by assessing the adequacy of study characteristics. The primary meta-analysis will use random effects models due to expected inter-studies heterogeneity. Dichotomous data will be analysed using relative risk and continuous data using weighted mean differences (or standardised mean differences), both with 95% confidence intervals.**

Discussion: The findings from this systematic review will be discussed in the context of strengthening routine childhood immunisation services, routine adolescent immunisation services, and introduction of future vaccines against tuberculosis and HIV/AIDS.

1
2
3 **Study strengths:** unbiased selection of many studies conducted in different
4 settings. This will strengthen the validity of the review results.
5
6

7
8 **Study limitations:** heterogeneity of the study settings of the low-income, lower-
9 middle income and upper-middle income countries as well as heterogeneity in
10 study designs.

Background

Infectious diseases are prevalent in low-income and middle-income countries (LMICs). For example, tuberculosis (TB) is a pandemic of great public health concern. In 2011, the World Health Organization (WHO) estimated that 1.4 million people died worldwide from TB [1]. To control the TB pandemic, stakeholders have proposed multipronged approaches; including development of new and more effective vaccines, novel and better drug regimens, faster and more accurate diagnostic tools as well as strengthening of public health systems. Among these approaches, more effective TB vaccines are likely to have the greatest impact [2]. Research and development of new and better TB vaccines has been accelerated. There were twelve new TB vaccines candidates in human clinical trials in the year 2012 [3, 4]. For the effective TB vaccines to achieve the desired impact, vaccination coverage must be optimal.

Uptake of vaccines delivered through routine immunisation programmes remains variable, and often poor in many LMICs [5, 6], suggesting that routine immunisation services alone are insufficient to achieve optimal immunisation coverage in LMICs. Taking into account that TB burden is highest in LMICs [7], it is likely that future effective TB vaccines will not reach desirable vaccination coverage in these settings if delivered only through the routine immunisation services. Therefore, additional strategies will need to be adopted to improve immunisation coverage, including supplementary immunisation activities (SIAs)[8, 9]

1
2
3
4
5
6 SIAs have been successfully used in different disease conditions, including
7
8 typhoid , measles [10-12], polio [13], human papillomavirus [14] and cholera [15].
9
10 The major reported benefits of SIAs are increased immunisation coverage,
11
12 reduced disease spread and cost-effectiveness [16]. Abu-Raddad *et al* have
13
14 used a mathematical model to show a significant additive public health benefit in
15
16 the reduction of TB incidence by incorporating SIAs to other key interventions of
17
18 neonatal vaccination and better TB treatment and diagnostic tools [2].
19
20
21
22
23

24
25 However, the use of SIAs to improve immunisation coverage and prevents
26
27 disease outbreaks in LMICs relative to routine immunisation services remain
28
29 controversial [8, 17]. To utilise SIAs successfully in the control of TB with future
30
31 effective vaccines, it is worthwhile to synthesize the current best evidence on the
32
33 effectiveness of this strategy. A study conducted in South Africa, a middle-
34
35 income country with a high burden of TB, showed that TB incidence peaks in
36
37 adolescence and adolescents are the greatest force of *Mycobacterium*
38
39 *tuberculosis* (*M.tb*) infection within a population [18]. This study suggests that a
40
41 new effective TB vaccine would have the greatest impact in the control of TB
42
43 when targeted to the adolescent population. We propose to conduct a systematic
44
45 review to assess whether, at present, there exists evidence that SIAs improve
46
47 immunisation coverage and reduce disease burden in LMICs.
48
49
50
51
52
53
54

55 To the best of our knowledge, the most recent comprehensive systematic review
56
57
58
59
60

1
2
3 on SIAs was conducted by Dietz and Cutts in 1997 and involved studies
4
5 published up to 1992 [16]. Since then, there have been many changes, among
6
7 them, population increase [19], change in disease epidemiology [20], emergence
8
9 of anti-vaccine groups [21] as well as expanded healthcare infrastructure. These
10
11 changes may negatively affect the performance of immunisation services in
12
13 obtaining optimal vaccination coverage. Furthermore, new vaccines continue to
14
15 be incorporated to the existing Expanded Programme on Immunisation (EPI) [22,
16
17 23], adding more logistical and financial pressure to the routine immunisation
18
19 services.
20
21
22
23
24
25
26

27 In the context of these changes that may affect the vaccination coverage, it is
28
29 rational to hypothesize that at present, the effects of SIAs in complementing
30
31 routine immunisation services may be different from those reported in the past by
32
33 Dietz and Cutts in 1997. In support of this hypothesis, some authors reported that
34
35 SIAs negatively affect the routine immunisation services [24, 25] whereas some
36
37 studies, report the opposite: SIAs increase immunisation coverage and reduce
38
39 disease outbreaks [26-29]. Therefore, an up to date systematic review is critical
40
41 to provide evidence on the relevance of SIAs in the current health systems
42
43 environment. This evidence will be useful, particularly for LMICs because these
44
45 settings are the epicentre of vaccine-preventable diseases and (by definition)
46
47 have limited resources.

53
54
55
56
57
58
59
60

Objectives

- 1) To determine whether SIAs increase vaccination coverage and reduce disease outbreaks in LMICs
- 2) To describe the lessons learnt during SIAs and how these may guide the introduction of future vaccines (TB, HIV, malaria) in LMICs.

Methods

Types of studies:

We will consider primary studies with the following designs:

- Intervention studies: individually randomised controlled trials (RCTs), cluster-randomised controlled trials (cRCT), non-randomised control trials, interrupted time series (ITS), and controlled before-and-after studies (CBAs)
- Observational studies: cohort studies, case-control studies, and cross-sectional studies.

Review articles will be excluded.

Study settings

Studies conducted in LMICs as defined by the World Bank GDP ranking in July 2013.

Types of interventions

This study will focus on SIAs, also referred to as mass vaccination campaigns. SIAs are defined as immunisation activities whereby a vaccine is taken simultaneously to many residents of a community within a defined short space of time. We will exclude studies of routine immunisation services, that is, immunisation services rendered (at fixed, outreach or mobile sites) regularly throughout the year. In addition, mass campaigns conducted for other purposes other than immunisation, for example, mass information campaigns to educate communities about general health issues will not be included.

Types of outcome measures

Primary outcomes:

- Vaccination coverage achieved during SIAs
- Disease outbreaks
- Disease incidence

Secondary outcomes:

- Immunisation coverage

Search methods for identification of studies

A comprehensive search strategy will be developed, including various terms relating to SIAs and LIMCs, for identification of both published and unpublished articles with no language restriction. We will search academic peer-reviewed journals, grey literature (non-published or non-reviewed papers, reports), and

1
2
3 reference lists of relevant publications. The detailed electronic search strategy is
4 provided in appendix 1 while the summary of the search outputs retrieved from
5 different databases is in appendix 2.
6
7
8
9

10 11 12 **Electronic searches**

13
14 We will search the following electronic databases for primary studies: Pubmed,
15 Web of Science, Cochrane Central Register of Controlled trials (CENTRAL),
16 Scopus, Africa Wide, PDQ-Evidence, WHOLIS and CINAHL.
17
18

23

24 **Data collection and analysis**

25 **Selection of studies**

26
27 Two authors will independently screen the search outputs for potentially eligible
28 studies, compare their results, and resolve disagreements by discussion and
29 consensus. The two authors will then independently go through the full text of all
30 potentially eligible studies to assess whether the studies meet the inclusion
31 criteria defined by the study design, setting, intervention and outcomes.
32 Discrepancies in the list of eligible studies between the two authors will be
33 resolved through discussion and consensus.
34
35
36
37
38
39
40
41
42
43
44
45
46
47

48 **Data extraction**

49
50 A structured and standardised data collection form has been developed for
51 extracting data from the selected studies. The form will capture key study
52 characteristics, including methods, participants and outcomes (appendix 3). Prior
53
54
55
56
57
58
59
60

1
2
3 to use, the extraction form will be piloted on at least four included studies
4
5 identified randomly from the list of included studies.
6
7
8
9

10 **Assessment of risk of bias in included studies**

11
12 The quality of studies will be assessed using the Cochrane Collaboration's tool
13 for assessing risk of bias [30] for experimental studies and the **Scottish**
14 **Intercollegiate Guidelines Network (SIGN)** checklist for other study designs [31].
15
16
17
18
19
20
21
22

23 **Measures of treatment effect**

24
25 We will express the result of each study as a risk ratio with its corresponding
26
27 95% confidence intervals for dichotomous data, or mean difference with its
28
29 standard deviation for continuous data. We will conduct meta-analysis for the
30
31 same type of participants, interventions, study designs, and outcome measures
32
33 where homogeneity of data allows. Heterogeneity will be assessed using the chi-
34
35 squared test of homogeneity, and quantified using the I-squared statistic [32, 33].
36
37
38
39
40
41
42

43 **Dealing with missing data**

44 **The data will be analysed on an intention-to-treat basis as far as possible and**
45 **attempts will be made to obtain missing data from the original corresponding**
46 **author. Where missing data is unobtainable, imputation of individual values will**
47 **be undertaken for the primary outcomes only. For other outcomes, only the**
48 **available data will be analysed. Any imputation undertaken will be subjected to**
49 **sensitivity analysis. If studies report sufficient detail to calculate mean differences**
50
51
52
53
54
55
56
57
58
59
60

1
2
3 but no information on associated standard deviation (SD), the outcome will be
4
5 assumed to have standard deviation equal to the highest SD from other studies
6
7 within the same analysis.
8
9

10 11 12 **Data synthesis**

13
14 All eligible studies will be summarised and analysed using Stata version 12 for
15
16 Windows. Two authors will extract the data, the first author will enter all data and
17
18 second author recheck all entries. Disagreements will be resolved by discussion.
19
20 If the studies are sufficiently similar, we will combine the data using random-
21
22 effects model due to anticipated heterogeneity that may result from the difference
23
24 in methodology and study settings. Where the rating scales used in the studies
25
26 have a reasonably large number of categories (more than 10) the data will be
27
28 treated as continuous variables arising from a normal distribution. We will use
29
30 weighted mean difference (WMD) when the pooled studies use the same rating
31
32 scale or test, and the standardised mean difference (SMD), the absolute mean
33
34 difference divided by the standard deviation when the studies use different rating
35
36 scales or tests. When the rating scales used are fewer than 10 and more than
37
38 two, we will concatenate the data into two categories that best represent the
39
40 contrasting states of interest, and treat the outcome measure as binary. Study
41
42 results for dichotomous data will be expressed as relative risk (RR) and 95%
43
44 confidence interval (CI). Time-to-event outcomes or generic inverse variance
45
46 outcomes, such as survival time and time to cure will be expressed as the log
47
48 hazards ratio and 95% CI.
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 When studies cannot be combined for meta-analysis due to diversity of
4 interventions, narrative syntheses will be conducted and results of individual
5 studies will be displayed graphically to enable more succinct summary of
6 evidence.
7
8
9
10
11
12

13 **Unit of analysis**

14
15 All cluster randomised trials that meet the inclusion criteria will be included in the
16 meta-analysis after adjusting for design effect using variation inflation method
17 [34, 35]: design effect = $1 + (M - 1)ICC$, where M is the average cluster size and
18 ICC is the intra-cluster correlation coefficient. If the authors did not report the
19 ICC, we will use ICC from a similar published trial. For estimated values of ICC,
20 we will conduct sensitivity analyses using larger and smaller ICCs to determine if
21 the results are robust.
22
23
24
25
26
27
28
29
30
31
32
33
34
35
36

37 **Assessment of heterogeneity**

38 We anticipate substantial variation in study results due to differences in the study
39 design, co-interventions, study settings (low-income versus lower-middle-income
40 versus upper-middle-income countries), and risk of bias. We will examine
41 statistical heterogeneity between study results using the Chi-squared test of
42 homogeneity (with significance defined at the alpha-level of 10%), and quantify
43 any statistical heterogeneity between study results using the I-squared statistic
44 [30].

Assessment of reporting biases

A funnel plot will be used to investigate the risk of publication bias by intervention type, provided 10 or more studies are included in the analysis for each intervention type [36, 37]. The funnel plot will be critically examined for asymmetry.

Sensitivity analysis

We will conduct sensitivity analysis to establish if the meta-analysis results are influenced by: the effect of study designs; publication type (peer-reviewed versus grey literature) the geographical settings (low-income versus lower-middle-income versus upper-middle-income countries); and study period (published before 2000 versus published after 2000).

Discussion

This systematic review will establish whether SIAs improves immunisation coverage, prevent disease outbreaks, and have negative impact on routine immunisation services in LMICs. The review will provide an up-to-date evidence base of the benefits and harms of the use of SIAs in the control of vaccine-preventable disease. Additionally, we will discuss how the findings of this review may be applicable in the context of future vaccines against TB, HIV and malaria.

Potential interference of SIA with routine immunization services investigated	<input type="checkbox"/> Yes (explain): <input type="checkbox"/> No	
Personnel performing the vaccinations during the SIAs	<input type="checkbox"/> Doctors <input type="checkbox"/> Nurses <input type="checkbox"/> Volunteers <input type="checkbox"/> Other (specify)	
Number of personnel performing the vaccinations during the SIAs (if provided)		
Notes:		

5) Participants

Characteristics	Description	Reference page/table or figure in the study
SIA setting	<input type="checkbox"/> Rural community <input type="checkbox"/> Urban <input type="checkbox"/> Displaced <input type="checkbox"/> Other (specify)	
Socio-economic status of the target population relative to the general population	<input type="checkbox"/> Low (L) (AA) <input type="checkbox"/> Average (A) <input type="checkbox"/> Above average <input type="checkbox"/> All (L, A &AA) <input type="checkbox"/> Not clear	

1 2 3 4 5 6 7 8 9	Methods used to classify the socio-economic status of the SIAs target population		
10 11 12 13 14	Total number of participants enrolled for the SIAs		
15 16 17	Age		
18 19 20 21	Gender	<input type="checkbox"/> Female <input type="checkbox"/> Male <input type="checkbox"/> Both	
22 23 24 25 26 27	Notes (provide any other relevant information on the participants):		

6) Outcome measures

Details of the outcome	Characteristics of the outcomes				Reference page/table or figure in the study
		F	M	Total	
Participants vaccinated during the SIAs period <i>(NB: If SIAs were conducted in more than one phase, duplicate as appropriate).</i>	Targeted				
	Vaccinated				
	Coverage attained				
Routine immunization	Before:				

<p>coverage before and after SIAs (NB: If SIAs were conducted in more than one phase, duplicate this row as appropriate).</p>	<p>After:</p>	
<p>Incidence of target disease before and after SIAs (NB: If SIAs were conducted in more than one phase, duplicate this row as appropriate).</p>	<p>Before:</p>	
<p>Incidence of target disease before and after SIAs (NB: If SIAs were conducted in more than one phase, duplicate this row as appropriate).</p>	<p>After:</p>	
<p>Percentage reduction or increase in the routine immunization coverage (NB: specify increase or decrease)</p>		
<p>Notes:</p>		

7) Risk of bias assessment

Type of bias	Tick appropriately and describe below after the tick.	Reference page/table or figure in the study
<p>Is there selection bias? (Assess</p>	<p><input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Unclear</p>	

<p>comparability of groups at baseline, confounding and adjustment. For RCTs assess sequence generation and allocation concealment).</p>		
<p>Is there performance bias? (Assess fidelity of the interventions, and quality of the information regarding who received which interventions, including blinding of study subjects and healthcare providers)</p>	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Unclear	
<p>Is there detection bias? (Assess whether there was biased and correct appraisal of outcomes, including blinding of assessors)</p>	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Unclear	
<p>Is there attrition bias? (Assess the completeness of sample, follow-up and outcome data, reasons for loss to follow up explained)</p>	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Unclear	
<p>Is there reporting bias (Assess selective reporting of results)</p>	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Unclear	
<p>Other biases (specify)</p>	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Unclear

Appendix 2: Summary of the search outputs retrieved from different databases using the proposed search strategy

Name of the database	Number of search outputs retrieved	Status of the search process
Pubmed	3578	Completed
Web of Science	1746	Completed
Cochrane Central Register of Controlled trials (CENTRAL)	281	Completed
Scopus	2914	Completed
Africa Wide	1042	Completed
PDQ-Evidence	157	Completed
WHOLIS	14	Completed
CINAHL	194	Completed

Appendix 3: Proposed data extraction form

1) Details of person extracting the data

	Description	Comments
Name of researcher completing the form		
Date when form completed (dd/mm/yyyy)		

2) General information

Description of the study	Enter as appearing in the publication	Reference page/table or figure in the study
Study ID based on surname of first author and year (e.g <i>Hussey 2001</i>)		
Study reference		
Correspondence author and the contact details:		
Publication type	<input type="checkbox"/> Full text <input type="checkbox"/> Abstract <input type="checkbox"/> Governmental or chapter non-governmental reports <input type="checkbox"/> Book <input type="checkbox"/> Other (specify)	
Source of funding and cost of SIA per participant		
References of potentially eligible studies from the reference list		
Notes/Comments		

3) Study eligibility assessment

Characteristics	Tick or describe as appropriate	Reference page/table or figure in article
Primary study	<input type="checkbox"/> Yes (Primary) <input type="checkbox"/> No	
Type of study design		
Unit of allocation to the intervention <i>(if applicable)</i>	<input type="checkbox"/> Individual <input type="checkbox"/> Household <input type="checkbox"/> Cluster <input type="checkbox"/> Other (Specify)	
Informed consent obtained for study <i>(if applicable)</i>	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Unclear	
Ethical approval obtained for study <i>(if applicable)</i>	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Unclear	
SIAs conducted in LMIC	<input type="checkbox"/> Yes <input type="checkbox"/> No	
If yes, category of country or countries	<input type="checkbox"/> Low-income country <input type="checkbox"/> Lower middle-income country <input type="checkbox"/> Upper middle-income country	
Name of the country		
Study describes SIAs	<input type="checkbox"/> Yes <input type="checkbox"/> No	

Name of vaccine used in the SIAs		
Disease targeted by the SIAs		
Outcome measures	<input type="checkbox"/> Yes Vaccination coverage attained by the SIAs <input type="checkbox"/> Yes Disease outbreaks <input type="checkbox"/> Yes Disease incidence <input type="checkbox"/> Yes Routine immunization coverage after SIAs) <input type="checkbox"/> Other (specify): <input type="checkbox"/> No	
Final decision on study eligibility	<input type="checkbox"/> Yes (Include) <input type="checkbox"/> No (Exclude)	
Reason(s) for exclusion		

NB: Do not proceed to the next step if the study is excluded from the review

4) Study aims and methods

	Describe as stated in report/paper/book chapter	Reference page/table or figure in the study
Aim(s)		
Methods to estimate target population for SIAs		

1 2 3 4 5 6	Methods to estimate SIAs coverage		
7 8 9 10 11	Period between SIAs and coverage survey (if applicable)		
12 13	SIAs start date		
14 15 16 17 18 19 20 21 22 23	SIAs end date <i>(NB: If SIAs were conducted in more than one phase, duplicate the two rows as appropriate).</i>		
24 25 26 27 28 29 30 31 32	Total duration of the SIAs (in days) <i>(NB: If SIAs were conducted in more than one phase, duplicate this row as appropriate).</i>		
33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49	Means of communicating the information about the SIAs to the target population (phase 1) <i>(NB: If SIAs were conducted in more than one phase, duplicate this row as appropriate).</i>	<input type="checkbox"/> Healthcare facility <input type="checkbox"/> Door to door <input type="checkbox"/> Word of mouth <input type="checkbox"/> Mass media (radio, TV etc) <input type="checkbox"/> Digital media (text message, emails etc) <input type="checkbox"/> Other (specify):	
50 51 52 53 54 55 56 57 58 59 60	Potential interference of SIA with routine immunization services investigated	<input type="checkbox"/> Yes (explain): <input type="checkbox"/> No	

<p>Personnel performing the vaccinations during the SIAs</p>	<p><input type="checkbox"/> Doctors</p> <p><input type="checkbox"/> Nurses</p> <p><input type="checkbox"/> Volunteers</p> <p><input type="checkbox"/> Other (specify)</p>	
<p>Number of personnel performing the vaccinations during the SIAs (if provided)</p>		
<p>Notes:</p>		

5) Participants

Characteristics	Description	Reference page/table or figure in the study
<p>SIA setting</p>	<p><input type="checkbox"/> Rural community <input type="checkbox"/> Urban <input type="checkbox"/> Displaced</p> <p><input type="checkbox"/> Other (specify)</p>	
<p>Socio-economic status of the target population relative to the general population</p>	<p><input type="checkbox"/> Low (L) (AA) <input type="checkbox"/> Average (A) <input type="checkbox"/> Above average</p> <p><input type="checkbox"/> All (L, A &AA) <input type="checkbox"/> Not clear</p>	
<p>Methods used to classify the socio-economic status of the SIAs target population</p>		

Total number of participants enrolled for the SIAs		
Age		
Gender	<input type="checkbox"/> Female <input type="checkbox"/> Male <input type="checkbox"/> Both	
Notes (provide any other relevant information on the participants):		

6) Outcome measures

Details of the outcome	Characteristics of the outcomes					Reference page/table or figure in the study
